Calculate V^R , H^R , and S^R for each of the following using the generalized virial method:

- (e) Ethylbenzene at 620 K and 20 bar.
- (f) Methane at 250 K and 90 bar.

Solution Part (e) - Ethylbenzene at 620 K and 20 bar

Estimate the entropy change of vaporization of benzene at 50 deg C. The vapor pressure of benzene is given by the equation:

$$ln(P^{sat}/kPa) = 13.8858 - \frac{2,788.51}{(t/degC) + 220.79}$$

- (a) Use Eq. 6.86 with an estimated value of ΔV^{lv} .
- (b) Use the Clausius-Clapeyron equation of Example 6.6.

Solution to Part (a)

Equation 6.86 is:
$$\frac{dP^{sat}}{dT} = \frac{\Delta H^{lv}}{T\Delta V^{lv}}$$
 and Equation 6.84 is $\Delta H^{lv} = T\Delta S^{lv}$, so $\Delta S^{lv} = \frac{\Delta H^{lv}}{T}$.

Rearrange 6.84 and combine with 6.86 to give $\Delta S^{lv} = \frac{dP^{sat}}{dT} \Delta V^{lv}$.

Estimate ΔV^{lv} by assuming the vapor is an ideal gas at pressure P^{sat} and the molar volume of the liquid is negligible compared to the vapor. Get P^{sat} from the Antoine equation.

Psat[t_] =
$$E^{13.8858 - \frac{2788.51}{(t-273.15) + 220.79}}$$
; (*Antoine equation with T in Kelvins*)

In[•]:= Psat [323.15]

Out[•]=

36.1658552072

(*Estimate ΔV^{lv} by assuming molar volume of

liquid is ~0 that the vapor is ideal gas with PV=RT \rightarrow V= $\frac{RT}{D}$ *)

R = 8314.;
$$(*\frac{kPa*cm^3}{mol*K}*)$$

$$T = 50 + 273.15$$
;

$$V = R * T / P; (*units are cm3/mol*)$$

$$\Delta V l v = V - 0$$

Out[•]=

74 287.4483295

(*Rearrange 6.84 and combine with 6.86 to give $\Delta S^{1v} = \frac{dP^{sat}}{dT} \Delta V^{1v} .*$)

$$\Delta Slv[t_{-}] = \partial_t Psat[t] * \Delta Vlv;$$

$$\Delta Slv[T]$$
 (*Units are $\frac{kPa*cm^3}{mo1*K}$ *)

Out[•]=

102169.470398

(*Convert
$$\frac{kPa*cm^3}{mol*K}$$
 to $\frac{J}{mol*K}*$)

$$ln[*] := \Delta Slv[T] * \frac{kPa * cm^3}{mol * K} * \frac{1 m^3}{10^6 cm^3} * \frac{1000 Pa}{1 kPa} * \frac{1 J}{1 m^3 * Pa}$$

Out[•]=

(*The entropy of vaporization at 50 degrees C from equation 6.86 is 102.169 $\frac{1}{\text{mol}*K}$. //ANS*)

Solution to Part (b)

The Clausius-Clapeyron equation is found on p. 237: $\Delta H^{IV} = -R \frac{d \ln P^{\rm sat}}{d (1/T)}$, so by equation 6.84, $\Delta S^{Iv} = \frac{-R}{T} \frac{d \ln P^{\rm sat}}{d (1/T)}$

Part (b) is very similar to part (a) but we have to find ln P^{sat} as a function of 1/T. This is shown below.

$$ln[\cdot] = Psatx[x_] = Psat[1/x]; (*Substituted x = \frac{1}{t} *)$$

Out[•]= 36.1658552072

$$ln[*]:= \Delta Slvb[x_] = -R * x * \partial_x NatLogPsatx[x]; (*C-C equation with equation 6.84*)$$

$$\Delta Slvb[1/T]$$
 (*Units are $\frac{kPa \star cm^3}{mol \star k}$ *)

Out[•]= 102169.470398

$$(\star \frac{kPa\star cm^3}{mol\star K} \rightarrow convert units to \frac{kJ}{mol\star K}\star)$$

$$lo[*] = \Delta Slvb[1/T] * \frac{kPa * cm^3}{mol * K} * \frac{1m^3}{10^6 cm^3} * \frac{1000 Pa}{1 kPa} * \frac{1J}{1m^3 * Pa}$$

K mol

(*The entropy of vaporization at 50 C from the Clausius -Clapeyron equation is 102.169 $\frac{J}{mol*K}$. //ANS*)

Steam at 2,100 kPa and 260 deg C expands at constant enthalpy (as in a throttling process) to 125 kPa. What is the temperature of the steam in its final state and what is its entropy change? What would be the final temperature and entropy change for an ideal gas?

Solution

This problem uses the steam tables in Appendix E, and is similar to Example 6.9, which used the fact that entropy is constant from state 1 to state 2. This allowed enthalpy in state 2 to be calculated. Example 6.9 is somewhat more complicated than problem 25 because state 2 is a 2-phase mixture of saturated water and steam. The premise of the example was to use S_2 , S^{liquid} and S^{vapor} to calculate x^{liquid} and x^{vapor} , which are then used to calculate H^{liquid} , H^{vapor} , and H_2 . Problem 6.25 is somewaht simpler because we will see that state 2 is superheated steam (one phase), so no calculation of x^{liquid} and x^{vapor} is needed.

Quit[];

First, solve for the entropy and enthalpy at P_1 = 2100 kPa and T_1 = 260 degC by interpolation of data in Table E.2, page 717. The data must be interpolated between 250 and 275 deg C:

$$\begin{array}{l} \text{eq1} = \frac{260 - 250}{275 - 250} = \frac{\text{S1} - 6.5162}{6.6356 - 6.5162};\\ \\ \text{Solve[eq1, S1]} \left(* \frac{\text{kJ}}{\text{kg*K}} * \right) \\ \left\{ \left\{ \text{S1} \rightarrow 6.56396 \right\} \right\} \\ \\ \text{eq2} = \frac{260 - 250}{275 - 250} = \frac{\text{H1} - 2897.9}{2961.9 - 2897.9};\\ \\ \text{Solve[eq2, H1]} \left(* \text{kJ/kg*} \right) \\ \left\{ \left\{ \text{H1} \rightarrow 2923.5 \right\} \right\} \end{array}$$

Next, carefully study Table E.2 on page 707. Observe that the enthalpy value at 125 kPa is comparable to H_1 . That is, at 225 deg C, the enthalpy is 2923.9 kJ/kg, and at 200 deg C it is 2874.2 kJ/kg. We can see that 2874.2 < H_1 < 2923.9. Since H_1 is between these two values, we conclude that state 2 is indeed superheated steam. Therefore, we can interpolate this data to find the temperature:

eq3 =
$$\frac{T2 - 200}{225 - 200} = \frac{2923.5 - 2874.2}{2923.9 - 2874.2}$$
;
Solve[eq3, T2] (*deg C*)
{{T2 \rightarrow 224.7988}}

(*The final temperature of the steam is 224.80K. //ANS*)

Now, using Table E.2 on page 707, find entropy data at 125 kPa. Interpolate the entropy data using the known enthalpies to find the unknown entropy S2:

eq3 =
$$\frac{S2 - 7.7300}{7.8324 - 7.7300} = \frac{2923.5 - 2874.2}{2923.9 - 2874.2}$$
;
Solve[eq3, S2]

 $\{ \{ S2 \rightarrow 7.831576 \} \}$

Next, calculate ΔS:

$$\Delta S = 7.8316 - 6.5640 (*\frac{kJ}{kg*K}*)$$

1.2676

(*The entropy change is 1.268 $\frac{kJ}{kg\star K}$. //ANS $\!\star$)

For entropy change for an ideal gas, $\Delta S/R$ is given by equation 5.10 on page 188. But recall that the enthalpy is held constant in the problem statement. The only way for this to be possible is if T1 is equal to T2. This means the integral term in equation 5.10

$$\Delta Sig = \left(\int_{T1}^{T2} \frac{Cp}{T} dT - Log \left[\frac{P2}{P1} \right] \right) * R$$

In[
$$\circ$$
]:= R = 8.314; ($\star \frac{J}{\text{mol} \star K} \star$)

$$In[*]:= \Delta Sig = \left(-Log\left[\frac{125}{2100}\right]\right) * R$$

Out[0]=

23.45694

The units are in J per mol per K, and must be converted to kJ per kg per K to compare with values from the steam tables:

$$In\{*\}:= \Delta Sig * \frac{J}{mol * K} * \frac{1 mol}{18.015 g} * \frac{1000 g}{1 kg} * \frac{1 kJ}{1000 J}$$

Out[0]=

(*The entropy change for the ideal gas is 1.302 $\frac{kJ}{kg_{\star}K}$. //ANS*)

What is the mole fraction of water vapor in air that is saturated with water at 25 deg C and 101.33 kPa? At 50 deg C and 101.33 kPa?

Solution

Use the Antoine equation with constants from Table B.2 on p. 666. In the instructor's version of the book, Psat is in kPa and T is in deg C.

```
(*Water vapor pressure from Antoine Equation, p. 666*)
(*This Antoine Equation has T in deg C and P in kPa.*)
(*This was also given in Problem 6.101.*)
a = 16.3872;
b = 3885.70;
c = 230.170;
Psat[T_] = e<sup>a-b/T+c</sup>;
(*From Dalton's Law, at 25 degC:*)

ywater = Psat[25]/101.33
0.0314590113242

(*At 50 degC*)
ywater = Psat[50]/101.33
0.12242434827
```

An equimolar mixture of methane and propane is discharged from a compressor at 5,500 kPa and 90 deg C at a rate of 1.4 kg/sec. If the velocity in the discharge line is not to exceed 30 m/sec, what is the minimum diameter of the discharge line?

Thought Process:

(Identify) Molar volume comes from the EOS. If molar volume is in cm³/mol and molar flow rate in mol/sec were available, I could multiply them and get the volumetric flow rate.

$$\frac{cm^3}{mol} * \frac{mol}{sec}$$

$$\frac{cm^3}{sec}$$

(Identify) Mass flow rate is given. Molar flow rate comes from the mass flow rate divided by molar mass:

$$In[a]:= \frac{\frac{kg}{sec} * \frac{g}{kl}}{\frac{1g}{mol}}$$

$$Out[a]= \frac{mol}{sec}$$

(Identify) Velocity is given. If volumetric flow rate is in cm³/sec and velocity is in cm/sec were available, I could divide and get area:

$$\frac{\text{cm}^3 / \text{sec}}{\text{cm} / \text{sec}}$$

$$\text{cm}^2$$

(**Formulate**) Molar volume from the equation of state can be formulated with Table 3.1 and equations 3.41, 3.44, and 3.45 to give molar volume.

(Solve) Solve the equation of state for the molar volume using Mathematica. Use molar volume, molar mass, and mass flow rate to get volumetric flow rate. Use volumetric flow rate and velocity to get area and radius.

Solution

We will calculate the molar volume of the mixture, use molar volume and given mass flow rate to find volumetric flow rate. Then use given velocity and calculated volumetric flow rate to find area, and use the area to find the diameter.

Use psuedocritical parameters from eqs 6.78-6.82 with the SRK equation:

$$\begin{array}{ll} \ln |\alpha| - \omega = 0.5 * 0.812 + 0.5 * 0.152 ; (*Eq. 6.78*) \\ T_{pc} = 0.5 * 190.6 * 0.5 * 369.8 ; (*K*) (*Eq. 6.79*) \\ P_{pc} = 0.5 * 45.99 * 0.5 * 42.48 ; (*bar*) (*Eq. 6.80*) \\ T_{pr} = T / T_{pc} ; (*Eq. 6.81*) \\ P_{pr} = P / P_{pc} ; (*Eq. 6.82*) \\ \Omega = 0.08664 ; (*Table 3.1, SRK*) \\ \varpi = 0.42748 ; \\ \sigma = 1 ; \\ e = 0 ; \\ \alpha = \left(1 * (0.480 * 1.574 * \omega - 0.176 * \omega^2) * \left(1 - \sqrt{T_{pr}}\right)\right)^2 ; \\ a = \overline{\omega} \frac{\alpha * R^2 * T_{pc}}{P_{pc}} ; (*Eq 3.45*) \\ b = \Omega * \frac{R * T_{pc}}{P_{pc}} ; (*Eq 3.44*) \\ eq1 = P = \frac{R * T_{pc}}{V - b} ; (*Eq 3.44*) \\ \text{Quiet[sol1 = Solve[eq1, V]]} \\ (V \rightarrow 49.7662433 * 75.1235893 i), (V \rightarrow 49.7662433 * 75.1235893 i), (V \rightarrow 49.7662433 * 75.1235893 i), (V \rightarrow 449.418259)) \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = 449.418 (*molar volume of mixture in $\frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = \frac{cs^3}{mol} * 1) ; \\ \text{Intel: } V = \frac{cs^3}{mol} * 1) ; \\ \text$$$$$$$$$$$$$$$$$$$
