# INTRODUCTION

## Preface

West Point is committed to developing leaders capable of mastering the modern battlefield through the Academic Program. The challenges of future warfare are many: continuous armed conflict, the proliferation of technology, ethical and legal debates over combat obligations, and the speed of operations—to name a few. These challenges will require Army officers to think critically, innovate rapidly, and make informed decisions. For this reason, West Point's academic program requires cadets to complete both a robust interdisciplinary core curriculum as well as an academic major of their choice. The core curriculum – the broad liberal arts aspect of the cadet's education – covers academic fields ranging from Science, Technology, Engineering, and Math to the Social Sciences and Humanities. The academic major allows a cadet to focus on an academic field of their choice and gain intellectual depth.

This Redbook provides specific descriptions of the Academic Program's components that are designed to develop cadets into capable and forward-thinking leaders. It identifies majors and minors available to each class as well as a listing of all courses offered during each academic year and term. The Redbook also includes descriptions of some of our Academic Individual Advanced Development offerings that enrich what is taught in the classroom. Through these components, the Redbook serves as a reference document to use while deciding on a major and/or minor, refining a course of study, mentoring a cadet, or addressing questions concerning academic requirements and opportunities.

There are many additional resources to help cadets achieve their potential and pursue their intellectual passions. Company Academic Counselors (CACs) and Department Academic Counselors (DACs) are available to work with cadets to develop a personally enriching course of study. Information sessions, open houses, and other opportunities to engage in conversations with faculty and fellow cadets also provide cadets with the opportunity to learn more about majors, minors, and enrichment opportunities.

Faculty can rely on Educating Future Officers to describe how we maintain and enhance our tradition of academic excellence and innovation so that we can achieve our overall mission: “to build, educate, train, and inspire the Corps of Cadets to be commissioned leaders of character committed to the Army values and ready for a lifetime of service to the Army and the Nation.”

I wish you all the best of luck during the upcoming academic year. Thank you for committing to the critical and creative thinking that the Army needs. Live honorably, lead honorably, and demonstrate excellence.

SHANE R. REEVES  
Brigadier General, USA  
Dean of the Academic Board

MADN

01 July 2025

**MEMORANDUM FOR** Cadets, Staff, and Faculty**SUBJECT:** FOREWORD: Academic Program (Redbook), AY 2026

1. The Academic Year (AY) 2026 Redbook is a guide for the Academic Program at the United States Military Academy. Used as a reference, this Redbook enables cadets to design and refine their academic programs and provides faculty information to guide and mentor cadets about and through the academic curriculum. This version contains all courses offered in academic year 2026 and the majors and minors for the Classes of 2025-2029.
2. Parts 1 and 2 of the Redbook present information about the United States Military Academy's educational philosophy, graduation requirements, academic standards, core curriculum, and academic discipline descriptions. Part 3 presents a catalog of all the courses offered at the Military Academy. Parts 4 and 5 provide different approaches to explore majors and minors.
3. Substantive revisions to the majors, minors, and courses as well as any substantive changes to other parts of the Redbook are listed by department in an appendix at the end of the Redbook.
4. Cadets should take ownership of their academic schedule and choose the major and elective courses that fit their intellectual interests and best prepares them to be officers. Cadets in all classes should review and revise their academic schedule, while ensuring they are meeting program requirements and registrar deadlines. Cadets are encouraged to discuss their current program and plans with their Company Academic Counselors (CACs) or Department Academic Counselors (DACs), as appropriate.
5. This volume supersedes all other Redbooks.
6. We welcome suggestions that will improve the Redbook. Please send all comments, suggestions, and edits on the Redbook to [AARS.All@westpoint.edu](mailto:AARS.All@westpoint.edu).

SUSAN RICHARDSON  
Vice Dean for Academic Affairs  
United States Military Academy

# **PART I: THE ACADEMIC PROGRAM**

# PART I: THE ACADEMIC PROGRAM

## USMA EDUCATIONAL PHILOSOPHY

### USMA Mission:

*To build, educate, train, and inspire the Corps of Cadets to be commissioned leaders of character committed to the Army Values and ready for a lifetime of service to the Army and Nation.*

**WPLDS:** The West Point Leader Development System (WPLDS) is a comprehensive and integrated approach designed to harness every facet of the West Point experience while leveraging specific developmental events and activities to reinforce and assess character and honorable living. Upon commissioning, West Point graduates will:

1. Live honorably:
  - Internalize the Cadet Honor Code, West Point Motto, and Army Values.
  - Demonstrate moral courage regardless of personal consequences.
  - Treat others with dignity and respect.
  - Act with humility and professional decorum in all environments through appearance, demeanor, behaviors, and words.
2. Lead honorably:
  - Accomplish the mission consistent with the Army values.
  - Know, adhere to, and enforce standards.
  - Build cohesive and effective teams.
3. Demonstrate excellence:
  - Maximize academic, military, and physical performance.
  - Seek challenges and feedback; reflect and improve.
  - Communicate and interact effectively.
  - Anticipate and solve complex problems.

## ACADEMIC PROGRAM GOALS

In support of WPLDS, the Academic Program has established the following overarching goal and seven Academic Program Goals (APGs) to help guide the academic development of cadets. Each of the seven goals is accompanied by supporting objectives called "What Graduates Can Do" (WGCD) statements. WGCD statements define specific indicators of skills expected of cadets at the time of graduation and are the assessable objectives that we use to determine if our core and major programs are achieving the standards of our program goals as expected. Each are listed below their respective APG in the following list. Our APGs also directly reflect upon, connect with, and contribute to achievement of the institutional outcomes defined within WPLDS.

**The Overarching Academic Goal:** Graduates integrate knowledge and skills from a variety of disciplines to anticipate and respond appropriately to opportunities and challenges in a changing world.

### Academic Program Goals:

**1. Communication:** *Graduates communicate effectively with all audiences.*

WGCD 1.1: Listen actively, read critically, and develop an informed understanding of the communications of others.

WGCD 1.2: Speak and write using Standard American English.

WGCD 1.3: Effectively convey meaningful information to diverse audiences using appropriate forms and media.

WGCD 1.4: Communicate in a foreign language.

WGCD 1.5: Use sound logic and relevant evidence to make convincing arguments.

**2. Critical Thinking and Creativity:** *Graduates think critically and creatively.*

- WGCD 2.1: Identify the essential aspects of a situation and ask relevant questions.  
 WGCD 2.2: Integrate knowledge and skills from a variety of disciplines.  
 WGCD 2.3: Make meaningful connections and distinctions among diverse experiences and concepts.  
 WGCD 2.4: Reason both quantitatively and qualitatively.  
 WGCD 2.5: Think innovatively and accept risk to pursue solutions in the face of ambiguity.  
 WGCD 2.6: Value reflection and creativity; envision possibilities.

**3. Lifelong Learning:** *Graduates demonstrate the capability and desire to pursue progressive and continued intellectual development.*

- WGCD 3.1: Demonstrate the willingness and ability to learn independently.  
 WGCD 3.2: Engage successfully in deliberate self-directed and collaborative learning experiences.  
 WGCD 3.3: Pursue self-awareness and embrace the responsibility for personal intellectual development.  
 WGCD 3.4: Pursue knowledge in areas of personal or professional interest.

**4. Ethical Reasoning:** *Graduates recognize ethical issues and apply ethical perspectives and concepts in decision making.*

- WGCD 4.1: Understand the intellectual foundations of ethical principles.  
 WGCD 4.2: Recognize ethical components of problems and situations.  
 WGCD 4.3: Examine and evaluate different ethical perspectives, principles, and concepts in context.  
 WGCD 4.4: Apply ethical perspectives and concepts in solving complex problems, including those found in military settings.

**5. Science, Technology, Engineering, and Mathematics:** *Graduates apply science, technology, engineering, and mathematics concepts and processes to solve complex problems.*

- WGCD 5.1: Apply mathematics, science, and computing to model devices, systems, processes, or behaviors.  
 WGCD 5.2: Apply the scientific method.  
 WGCD 5.3: Collect and analyze data in support of decision making.  
 WGCD 5.4: Apply an engineering design process to create effective and adaptable solutions.  
 WGCD 5.5: Explain and apply computing and information technology concepts and practices in the context of the Cyber Domain.

**6. Humanities and Social Sciences:** *Graduates apply concepts from the humanities and social sciences to understand and analyze the human condition.*

- WGCD 6.1: Understand, analyze, and know how to influence human behavior.  
 WGCD 6.2: Analyze the history, diversity, complexity, and interaction of cultures.  
 WGCD 6.3: Analyze political, legal, military, and economic influences on social systems.  
 WGCD 6.4: Engage in and reflect on cross cultural experiences.  
 WGCD 6.5: Integrate the methodologies of the humanities and social sciences in decision-making.

**7. Disciplinary Depth:** *Graduates integrate and apply knowledge and methodological approaches gained through in-depth study of an academic discipline.*

- WGCD 7.1: Apply disciplinary tools, methods of inquiry, and theoretical approaches.  
 WGCD 7.2: Identify and explain representative questions and arguments of their chosen disciplines.  
 WGCD 7.3: Recognize limits of a discipline as well as areas in which it contributes to intellectual inquiry and problem solving.  
 WGCD 7.4: Synthesize knowledge and concepts from across their chosen disciplines.  
 WGCD 7.5: Contribute disciplinary knowledge and skills as a part of a collaborative effort engaging challenges that span multiple disciplines.

## ACCREDITATION

The United States Military Academy is accredited by the Middle States Commission on Higher Education, 1007 North Orange Street, 4th Floor, MB #166, Wilmington, DE 19801 (267-284-5011). The Middle States Commission on Higher Education is an institutional accrediting agency recognized by the U.S. Secretary of Education.

- The following USMA majors are accredited by the Engineering Accreditation Commission of ABET, <http://www.abet.org>:

- Chemical Engineering
- Civil Engineering
- Electrical Engineering
- Engineering Management
- Environmental Engineering
- Mechanical Engineering
- Nuclear Engineering
- Systems Engineering
- The following USMA majors are accredited by the Computing Accreditation Commission of ABET, <http://www.abet.org>:
  - Computer Science
  - Cyber Science
- The USMA major, Geospatial Science, is accredited by the United States Geospatial Intelligence Foundation (USGIF).
- The Chemistry Major with ACS Certification track is approved by the Committee on Professional Training of the American Chemical Society (ACS).

## THE ACADEMIC PROGRAM

The Academic Program is that broad structure within USMA which is responsible for the intellectual development of cadets. It consists of courses, minors, majors, activities, and departments, and is headed by a Brigadier General, the Dean of the Academic Board.

## GRADUATION REQUIREMENTS AND ACADEMIC STANDARDS

Army Regulation 150-1, United States Military Academy Organization, Administration and Operation states that First Class cadets who have successfully completed the requirements of the course of instruction, including academic, military, and physical development programs; have maintained prescribed standards of conduct; and who have demonstrated proper moral-ethical qualities, leadership, and character may receive a diploma signed by the Superintendent, USMA, the Commandant of Cadets, and the Dean of the Academic Board. These cadets will have earned the Bachelor of Science degree and will be designated graduates of USMA. Graduation requirements for all three programs — academic, military, and physical — and institutional (non-program) requirements by class year are available through the following link: Classes of [2024–2026](#), Classes of [2024–2026 Addendum](#), Class of [2027](#), Class of [2028](#), and Class of [2029](#).

## ACADEMIC GRADUATION REQUIREMENTS

To satisfy the academic portion of these graduation requirements, a cadet must:

- Complete successfully or validate each course in the core curriculum, including the common core courses and a core engineering sequence
- Satisfy the requirements of at least one major
- Successfully complete 40 academic courses of at least 3.0 credit hours each. Validated and remedial courses cannot count towards this requirement.
- Achieve a 2.00 Cumulative Quality Point Average (CQPA). The CQPA is calculated based on letter-grade performance for any academic, physical, or military course with credit hours. It generally corresponds to grade point average (GPA) in other colleges and universities.

As part of the West Point experience, a cadet is required to complete requirements and achieve minimum standards in three developmental programs within the USMA West Point Leader Development System (WPLDS). Within the WPLDS, the military program score (MPS), the physical program score (PPS), and the academic program score (APS) combine to form the cadet performance score (CPS). The score is calculated by first normalizing each program score to a mean zero and standard deviation of one and then calculating a weighted average based on a cadet's three normalized scores. A complete explanation of the calculation of the CPS, which ultimately determines a cadet's class rank, can be found at this link ( [CPS Calculation](#) ). The APS is based on performance in courses within the Academic Program and does not include military science and physical education courses. Refer to DPOM 02-01 for APS computation details. Cadets who are deficient in one or more of the three developmental programs for failure to maintain minimum program performance standards may be considered by the Academic Board for separation.

The United States Military Academy's academic curriculum has two significant structural features. The first is a core of

twenty-four academic courses that the Academy considers essential to the broad base of knowledge necessary for all graduates and a three-course core engineering sequence for those cadets who do not choose to major in engineering. This core academic curriculum, when combined with physical education and military science, provides USMA cadets with the necessary knowledge, skills, and attributes necessary for future officers in the U.S. Army. The second structural feature is the opportunity to specialize and explore an area in depth through the selection of an academic major consisting of not less than thirteen required or elective courses.

## WHAT CONSTITUTES A COURSE

Although 'course' is a commonly used word in curriculum descriptions, USMA has the following requirements for an educational experience to be termed a 'course.' Each course is different in many specific ways. In general, however, there are guidelines for any course of instruction which contribute to it being worthy of academic credit. The development of a course along the following lines is what is required for a course to be included for academic credit on a cadet's academic transcript.

**Course outcomes that require new learning experiences.** Learning involves a change in capabilities or dispositions that can be attributed to experience. "Change" usually implies students acquiring a new capability or disposition: what they know (knowledge), how they use what they know (intellectual skills), how they think, what they can do (physical skills), or what they value (attitudes and values). Learning is not normally considered as maintenance of already acquired capabilities. A course of instruction then is the purposeful arrangement of experiences designed to facilitate intended change in students' capabilities or dispositions which we represent by course outcomes.

**A valid comprehensive method of evaluating student mastery of course outcomes.** Student evaluation is a critical component of the learning process and must be present in a course of instruction. We recognize that evaluation methods and the frequency of evaluation will vary as a function of course outcomes; however, the evaluation method should assess students' mastery of course outcomes and should permit valid inferences about student learning.

If a course of instruction meets the preceding two guidelines, then the awarding of credit hours should be based on a calculation of planned time (40 hours of planned time associated with 1.0 credit hour). A 3.0 credit hour course usually requires 40 instructor contact hours with two hours of preparation required for each hour in class: 40 lessons at 3hrs/lesson (1 contact hour in-class and 2 hours of outside preparation) = 120 hours = 3.0 credit hours; 30 lessons at 4hrs/lesson (1.25 contact hours in-class and 2.75 hours of outside preparation) = 120 hours = 3.0 credit hours.

## ACADEMIC COURSE LOADS

The minimum load that all cadets must carry under normal circumstances is five academic courses which are equal to or greater than 15 semester hours of credit. Plebes may take four academic courses in the semester where they have MS100 and PE215. In addition, cadets will meet established requirements for physical education courses and military science core curriculum during a regular academic semester.

During the summer, the Military Academy provides opportunities to pursue Academic Individual Advanced Development (AIAD) and to complete coursework in the Summer Term Academic Plan (STAP). Under some circumstances, STAP may be used to reduce a course load during the academic year to four courses for a term.

## OVERLOADING

Cadets are considered overloading when they are carrying seven academic courses in a term. Overload courses offer the means of adapting an academic program to capitalize upon a cadet's abilities and to satisfy a particular interest. During the Third, Second, and First Class years, cadets may wish to enroll in one overload course for each term. Approval will depend upon demonstrated ability and motivation. Specifically, Dean's List recognition in the preceding term is required. Cadets with a Cumulative Quality Point Average (CQPA) of 2.30 or higher may overload in their First Class year. The designated overload course must be a course that can be dropped without jeopardizing any academic graduation requirements (e.g., core courses, primary major courses).

Cadets are required to designate which of their courses is the designated overload course. No change in this designation will be permitted after the term begins. A cadet who enrolls in an overload course and finds it unsuited to his or her needs may request withdrawal from the overload course through the Academic Affairs and Registrar Services (AARS), Office of the Dean, any time after the first month of the term and up until the beginning of Term End

Examinations (TEE). The Dean may remove a cadet from an overload course for poor performance in that course or in any other course.

## VALIDATION AND ADVANCED COURSE ENROLLMENT

Advanced Placement test scores and previous high school or college academic records are reviewed by the academic departments to determine whether a cadet is eligible for validation of certain courses. Many academic departments use examinations and personal interviews, in addition to screening academic records, to assist in their evaluation. When the process is completed, a cadet may be offered the opportunity to validate a course. Once validated, the decision to take the course is entirely the cadet's to make; cadets should keep in mind, however, that they may have to replace the validated course with another course. The significant aspects of validation are that it is voluntary, and that, while it excuses a cadet from taking a course, it does not reduce graduation course requirements. Validated courses will be reflected without credit hours on the transcript. However, the credit hour content of validated courses is recognized as contributing appropriate disciplinary content towards meeting programmatic rigor for accreditation purposes.

## OVERVIEW OF THE ACADEMIC CURRICULUM

The two charts below further highlight an overview of the academic program. The first chart, figure 1, presents the curriculum in overall blocks of course requirements. The second chart, figure 2, presents the typical sequence of courses taken over eight semesters during a cadet's 47-month experience.

| 37 Core Course Curriculum |                                | 13 Courses for the Major                                                                                                                                                                                                                                                           |                              |

**37 Core Course Curriculum**

|    |                           |
|----|---------------------------|
| 1  | Chemistry 1               |
| 2  | Physics 1                 |
| 3  | Chem 2 / Physics 2 / Bio  |
| 4  | Math (Modeling)           |
| 5  | Math (Calculus)           |
| 6  | Math (Statistics)         |
| 7  | Cyber 1                   |
| 8  | Cyber 2 / STEM Depth      |
| 9  | Geography                 |
| 10 | Eng Sequence course 1     |
| 11 | Eng Sequence course 2     |
| 12 | Eng Sequence course 3     |
| 13 | Economics                 |
| 14 | Political Science         |
| 15 | International Relations   |
| 16 | History 1 (U.S. or World) |
| 17 | History 2 (Mil Art I)     |
| 18 | History 3 (Mil Art II)    |
| 19 | Composition               |

|    |                                  |
|----|----------------------------------|
| 20 | Literature                       |
| 21 | Philosophy & Ethical Reasoning   |
| 22 | Foreign Language 1               |
| 23 | Foreign Language 2               |
| 24 | Psychology                       |
| 25 | Constitutional/Military Law      |
| 26 | Military Leadership              |
| 27 | MS 1 Intro to Warfighting        |
| 28 | MS 2 Fund. of Small Unit Ops     |
| 29 | MS 3 Platoon Operations          |
| 30 | Officership (MX400)              |
| 31 | DPE 1 Boxing                     |
| 32 | DPE 2 Personal Fitness           |
| 33 | DPE 3 Military Movement          |
| 34 | DPE 4 Survival Swimming          |
| 35 | DPE 5 Combat Apps                |
| 36 | DPE 6 Army Fitness               |
| 37 | DPE 7 Lifetime Physical Activity |

**13 Courses for the Major**

|    |                              |
|----|------------------------------|
| 38 | Major course 1               |
| 39 | Major course 2               |
| 40 | Major course 3               |
| 41 | Major course 4               |
| 42 | Major course 5               |
| 43 | Major course 6               |
| 44 | Major course 7               |
| 45 | Major course 8               |
| 46 | Major course 9               |
| 47 | Complementary Support Course |
| 48 | Complementary Support Course |
| 49 | Complementary Support Course |
| 50 | Capstone                     |

**Integrative Curricular Components**

- Character Thread
- Study of War Thread
- West Point Writing Program
- MX400
- Three-Course Engineering Sequence

## ACADEMIC CORE CURRICULUM

The foundation of the academic program at USMA is 24 core courses and three courses in an engineering sequence for those cadets who do not choose a major in engineering. For most cadets the first year is a common academic experience including, in term 2, the selection of a major, followed by the selection of a three-course engineering sequence in the Fall of Third Class year.

Designed to provide educational breadth, the 24 academic core courses are listed below along with alternate sequences or courses. Cadets may be enrolled in authorized alternative courses to the academic core curriculum based on placement testing and/or validations. Alternative courses are usually more advanced versions of the basic core courses.

Fig 3: The 24 Core Academic Courses (and Alternates) by Discipline

Designed to provide educational breadth, the 24 academic core courses are listed above along with alternate sequences or courses. Cadets may be enrolled in authorized alternative courses to the academic core curriculum based on placement testing and/or validations. Alternative courses are usually more advanced versions of the basic core courses.

### **Mathematics, Science, and Engineering (MSE)**

Within the core academic curriculum, there is a strong emphasis on mathematics, science, and engineering. The MSE sequence provides each cadet with a fundamental knowledge of the experimental and analytic techniques of the basic sciences. This sequence begins in the Fourth Class year with two semesters of mathematics, one semester of chemistry, one semester of geography, and one semester of calculus-based physics. Geography or physics may be delayed until the Third Class year depending on faculty resources and cadet preferences. The coursework continues in the Third Class year with one semester of statistics and an additional science depth course that cadets select based on their major and their interests.

### **Humanities and Social Sciences (HSS)**

Additionally, the core curriculum includes a strong pre-professional sequence of courses from the humanities and social sciences to develop an awareness of the people, government, and society that the commissioned officer will serve. This sequence begins in the Fourth Class year with one semester of history, one semester of English composition, one semester of literature, and one semester of psychology. It continues in the Third Class year with one semester each of political science, philosophy, and economics. The Second Class year includes one semester of international relations, two semesters of military history, and one semester of military leadership. The First Class year's contribution to this sequence of professional development is found in a one-semester course in constitutional and military law and one semester of a capstone course titled "Officership."

### **Information Technology/Cyber**

The core curriculum also includes an information technology/cyber sequence (IT/CYBER) designed to ensure that every academy graduate is comfortable with and capable of securely using computers and information technology in an Army that must fight and win in an overarching cyber domain. IT/CYBER skills are first developed through an introductory information technology/cyber course in the Fourth Class year and the integration of computer and cyber applications throughout the core curriculum and particularly in the IT/CYBER requirement in the Second or First Class year. The IT/CYBER requirement may be fulfilled with the core course, CY305, Cyber Foundations or through existing course coverage of cyber topics in particular majors (in this case, the cadet will be required to fulfill a Science, Technology, Engineering and Math [STEM] depth requirement with another STEM course — see listing of core courses above).

### **Foreign Language**

Most cadets will begin their study of a foreign language in Third Class year. If a cadet expresses an interest, however, the sequence may be started in Fourth Class year (contingent on seat availability and discretion of the Registrar). All cadets will take at least two semesters of one of the eight foreign languages offered in residence. Course work will present perspectives from another culture, develop the ability to learn another language, provide an introductory level of proficiency in the language selected, and provide a firm foundation for further language study.

These features mean that the first two academic semesters are a common core experience for the majority of cadets, and most of the second two semesters are common as well. Individual alterations to the typical sequence can be made based on specific needs and capabilities. Cadets are encouraged to work closely with academic counselors when designing their academic programs.

## **Core Engineering Sequences (CES)**

Cadets will seek counsel from their DACs in the beginning of their Third Class year to request a CES that complements their academic major and interests. The Registrar will fill CES enrollments based on cadet preferences and faculty availability. CES assignments typically cannot be changed after the initial assignment unless the cadet finds a cadet 'trade partner' in the same year group who is willing to make a swap.

### **IN - Infrastructure Engineering**

MC300 Fundamentals of Engineering Mechanics and Design  
CE350 Infrastructure Engineering

## CE450 Construction Management

The Infrastructure Engineering Sequence focuses on the design, analysis, and construction of the built environment (i.e., man-made structures and facilities used to accommodate societies' activities). Cadets learn about the importance of the infrastructure sectors, such as water, power, and transportation, and their inter-relationships. The first course, **MC300 Fundamentals of Engineering Mechanics and Design**, provides cadets with foundational engineering mechanics as the basis for all structural elements in the context of learning the engineering design process. In the second course, **CE350 Infrastructure Engineering**, cadets learn to identify, analyze, and assess the built environment, which is the infrastructure foundation for modern society. Expanding upon the structural systems introduced in the first course, cadets engage in learning about water and wastewater, power, transportation, solid waste, communications systems, public administration, and sustainment. In the third course, **CE450 Construction Management**, cadets learn how to plan and execute construction of the built environment. The culminating event that brings together the two previous courses is the designing, planning, and presenting of a construction briefing of a base camp in a combat theater of operations. Integral to all three courses is an active learning environment with emphasis on classroom demonstrations, virtual and physical simulations, and practical exercises.

## CY - Cyber Engineering

CY300 Programming Fundamentals

CY350 Network Engineering and Management

CY450 Cyber Security Engineering

The Cyber Engineering Sequence focuses on fundamental cyber-enabling skills as well as current cybe-related issues, threats, vulnerabilities, and non-technical considerations. As the newest warfighting domain and branch of the Army, cyberspace presents new opportunities and demands for leaders to protect and exploit networks and information resources. Cyber leaders must understand computer systems, networks, and information assurance and be able to analyze, design, and evaluate such systems. The Cyber Engineering Sequence is designed to provide sufficient breadth and depth of knowledge for non-technical majors to establish a nucleus for subsequent learning and adaptation to rapid change. The first course, **CY300 Programming Fundamentals**, provides cadets with broad introduction to computer programming, which will allow them to design, build, and test small to medium programs. The second course, **CY350 Network Engineering and Management**, addresses the analysis, design, building, and testing of modern computer networks. Cadets implement and test wired and wireless networks using standard network models, protocols, and practices. In the final course, **CY450 Cyber Security Engineering**, cadets learn principles of information system security and best practices, and apply techniques and tools to evaluate and improve network security. The capstone integrative experience requires cadets to employ offensive and defensive cyber measures and consider the economic, socio-cultural, and political considerations that impact the technological solutions.

## RO - Robotics Engineering

EE300 Fundamentals of Digital Logic

EE350 Basic Electrical Engineering

EE450 Military Robotic Systems

The Robotics Engineering Sequence focuses on developing a basic understanding of the electrical and electronic technologies used in the military. The fundamentals of electrical power generation and distribution, information processing, computing, communications, and robotics are some of the examples that are developed across the engineering sequence. The first course, **EE300 Fundamentals of Digital Logic**, provides cadets with a basic understanding of digital electronics that are used for information processing, digital communications, and computing. The second course, **EE350 Basic Electrical Engineering**, provides cadets with a basic understanding of the analog electronics that are used for power generation, sensor measurements, electric motors, and radio communications. The final course, **EE450 Military Electronic Systems**, employs a semester-long robotics design project applied to a military setting. Cadets use previous course materials to understand how the robot works, the limitations and difficulties of programming artificial intelligence used in a military setting with a decision-making model to consider the economic, socio-cultural, and political considerations that impact the technological solutions.

## AI - Artificial Intelligence and Data Engineering

CS300 Programming Fundamentals

CS350 Data Engineering

CS450 Engineering AI

The Artificial Intelligence and Data Engineering (AIDE) Core Engineering Sequence (CES) equips cadets with practical skills to tackle the challenges in the modern data-driven world. This sequence focuses on fundamental programming and data engineering skills and the development and application of artificial intelligence models that rely on engineered data. The first course, **CS300 Programming Fundamentals**, provides cadets with a broad introduction to computer programming, allowing them to design, build, and test small to medium programs that use various data sets. The second course, **CS350 Data Engineering**, teaches cadets the skills to retrieve, validate, transform, visualize, and extract insights from data in various formats. Building on the skills developed in CS300 and CS350, **CS450 Engineering AI**, empowers cadets to implement AI models that enhance decision-making and perform rapid prediction. The depth and practical applicability of the skills taught in AIDE start cadets down the path toward mastery of data engineering and AI. This curriculum will prepare cadets to lead and innovate in various industries, providing critical competitive advantages, including strategic superiority for institutions such as the US Military.

## EV - Environmental Engineering

EV300 Environmental Science

EV350 Environmental Engineering Technologies

EV450 Environmental Engineering for Community Development

The Environmental Engineering Sequence focuses on current environmental issues and designing viable, sustainable solutions to them. The sequence emphasizes the science and engineering commonly used to protect public health and the environment. The experience gained allows graduates to address multiple perspectives across relevant Army topics such as installation drinking water and wastewater infrastructure, energy, and environmental stewardship. The first course, **EV300 Environmental Science**, provides Cadets with a broad understanding of what the term “environmental issues” encompasses on a global and local scale. Cadets analyze the influences, especially human, that cause change in the balance of the Earth’s natural and biological cycles. The second course, **EV350 Environmental Engineering Technologies**, explores environmental engineering from a unit process and mass balance approach. Cadets solve fundamental problems in drinking water, wastewater, air pollution, and solid/hazardous waste that would be encountered in a developed country. The final course, **EV450 Environmental Engineering for Community Development**, employs a semester-long design project to engineer solutions for a real-world case study in a developing world community. Cadets use a value-based decision-making model to consider the economic, socio-cultural, and political considerations that impact the technological solutions.

## NE - Nuclear Engineering

NE300 Fundamentals of Nuclear Engineering

NE350 Radiological Engineering Design

NE450 Nuclear Weapons and Weapons Effects

The Nuclear Engineering Sequence studies the practical use of the energy that is released by the nucleus. Applications extend into the fields of power generation, medicine, nuclear weapons, and nuclear weapons effects. The sequence is designed to provide introductory knowledge in the applications of nuclear energy and what Army officers should know about nuclear reactors, radiation health physics, radiation detection, and nuclear weapons and weapons effects. The first course, **NE300 Fundamentals of Nuclear Engineering**, provides cadets with an understanding of the nuclear particles and interactions important to the fission process. Cadets learn about radioactivity, the interactions of radiation with matter, and how to determine the state of criticality of a nuclear system. The second course, **NE350 Radiological Engineering Design**, explores the biological effects of radiation, the fundamentals of radiation protection and detection, the widespread medical and industrial uses of radiation technology, and the transportation, treatment, and disposal of radioactive waste. NE350 employs a semester-long nuclear application design project to engineer solutions for a given realistic situation. Cadets use a decision-making model to consider the economic, social, and political considerations that impact a technological solution. The final course, **NE450 Nuclear Weapons Effects**, introduces cadets to the basic design of nuclear weapons, and the full spectrum of their effects once employed. As future Army officers, cadets gain a necessary understanding of the risks to their soldiers operating in a nuclear environment, and what they need to know to mitigate those risks.

## SE - Systems Engineering

SE300 Introduction to Systems Engineering

SE350 Systems Modeling and Design

SE450 Applied Systems Design and Decision Making

OR

SE301 Foundation of Engineering Design and Systems Management  
EM384 Analytical Methods for Engineering Management  
SE450 Applied Systems Design and Decision Making

The Systems Engineering Sequence exposes Cadets to the fundamentals of the discipline, equips them with some of the more essential tools to facilitate modeling and analysis, and develops an inherent ability to use the Systems Decision Process (SDP) to solve complex problems. The Systems Engineering discipline develops and manages interdisciplinary engineering teams that develop, design, and implement systems. The first course, **SE300/SE301 Introduction to Systems Engineering**, provides the baseline approach to the fundamentals of systems thinking, systems engineering, and systems decision making. Cadets learn the methodological framework and techniques for designing, implementing, managing, and reengineering complex systems or processes and their life cycles, which they are taught using the SDP. The second course, **SE350/EM384 Systems Modeling and Design** focuses on developing a solid foundation of modeling principles, with a particular emphasis on spreadsheet modeling; instilling the ability to collect, clean, analyze system data; and developing the ability to apply both deterministic and stochastic techniques to model and analyze systems in support of the broader decision-making process. Cadets learn to apply these techniques to both military and industry-based systems, as well as systems they may encounter in their own disciplines. The sequence culminates with **SE450 Applied Systems Design and Decision Making**, which builds on the systems design and management skills learned in SE300/SE301, while incorporating material from courses in the USMA core curriculum. Cadets gain systems engineering experience via a semester-long integrative project that uses both the systems engineering design, modeling and analysis skills they have learned thus far, and the skills they have acquired in the core curriculum and their respective majors. Projects are selected to provide Cadets the experience of working for a real client with a real problem that requires an adaptive solution.

## Integrative Curricular Components (ICCs)

ICCs are parts of the curriculum that make thematic connections across selected courses or within the context of a course so that information and skills can be applied to novel and complex issues or challenges. In addition to the ICCs, the Academy offers many other interdisciplinary opportunities that cadets can choose, including the Interdisciplinary Humanities (XH), Science (XS), and Engineering (XE) courses and interdisciplinary minors. Courses can be found in Part 3 of the Redbook and Minors in Part 4.

ICCs include:

- [Character Thread](#)
- [Study of War Thread](#)
- Core engineering sequences
- MX400 (Officership)
- West Point Writing Program (WPWP)

The word “thread” is used to describe a group of courses linked by shared themes.

## Writing

The West Point Writing Program (WPWP) works across the curriculum to provide cadets and faculty with continuity, depth, and coherence in their study of composition, critical thinking, academic argument, writing pedagogy, and professional communication. In practice, it sets, assesses, and supports writing standards that prepare cadets to develop writing proficiency across the curriculum. Accordingly, it describes a pedagogical model and curricular principles that inform courses in the core and in individual majors, designated as First-Year Composition (FYC), Writing-in-the-Core (WiC), Writing-in-the-Major (WiM), and Writing-in-the-Profession (WiP). The overarching goal of the Writing Program is to provide cadets with continuity and coherence in their education so that all graduates are agile, clear, and thoughtful communicators. Particularly through Signature Writing Events, the Program encourages cadets to take ownership of their study and understand that writing effectively is integral to their professional development as officers and their lifelong learning.

## THE MAJOR

The United States Military Academy's curriculum requires cadets to complete at least one disciplinary depth component consisting of an academic major with a minimum of 13 courses. (Part 4 of the Redbook describes each academic major in detail.)

In general, an academic major at West Point consists of at least three components, which are listed below. All courses composing the thirteen-course major must be 3.0 credit hours or higher. Any courses beyond the minimum thirteen required for the major are not subject to this credit hour requirement.

1. The foundation of the major can be found in a study-in-depth component which consists of a minimum of nine courses (ten including the integrative experience; see #3 below) that may be a mixture of required and elective courses.
2. The second component of every major is a collection of three Complementary Support Courses (CSCs). The purpose of these courses is to provide cadets a broader understanding of their academic majors through disciplinary diversity and choice. The courses support the major by either building a foundation of knowledge otherwise absent from the Core Curriculum but required for a complete major or enriching the major by providing alternative viewpoints or modes of thought.
3. The final component of each major is an integrative experience course or courses. The integrative experience is designed to synthesize knowledge and skills nurtured in the core and major programs. Situated within the major, but drawing upon all goals, integrative experiences present cadets with professionally relevant situations that include political, social, economic, and technological issues and challenge cadets to anticipate and respond appropriately to opportunities and challenges in a changing world.

The listing of each academic major in Part 4 of the Redbook also includes entries for the select core requirements. Some academic majors may require certain courses to fulfill these requirements: Science Depth, STEM Depth, IT/Cyber, Core Engineering Sequence, and the West Point Writing Program Writing-in-the-Major course. Courses from the core curriculum may not be counted as part of the thirteen-course requirement for an academic major.

## CHOOSING A MAJOR

Choosing an area of academic specialization is one of the most important academic decisions a cadet will make at the Military Academy. Currently a major requires the commitment of a minimum of 13 courses. Once a cadet starts taking courses to support a major, it is very difficult and, in many cases, impossible to change to another major. Cadets are encouraged to seek guidance in arriving at this decision and to take the necessary time and effort to make that decision a good one.

Once a Fourth Class cadet designates a major, the cadet is passed from the company academic counselor to a counselor in the department that sponsors the chosen discipline. Departmental counselors then help the cadet plan the remaining six terms of his or her academic program, providing guidance on the sequencing of courses best designed to facilitate study of the discipline.

A minimum of 13 courses must be designated to fill the course requirements for the baseline area of academic specialization, arranged in semesters of five academic courses each. Cadets who choose an area requiring more than thirteen courses may need to complete additional academic courses (six or more) in future terms.

## DOUBLE MAJORS

Through validation, advanced placement, or overload, it is possible for a cadet to meet the requirements for more than a single major. Each cadet must officially pursue and gain credit for one major. Beyond that requirement a cadet is free to pursue and gain transcript credit for additional majors provided he or she meets the following guidelines:

- In pursuing two majors, a cadet must meet all curricular requirements, including student learning outcomes for each major, and double-count no more than seven total courses, with no more than four being study-in-depth courses. Integrative experience courses are considered study-in-depth courses.
- Department counselors in both fields must grant approval.
- The graduation transcript will reflect academic majors that have been satisfied.
- Cadets are warned that USMA will not guarantee the completion of additional majors, even though that cadet may have already completed courses towards that goal. Scheduling and resource constraints may prohibit the completion of additional majors.

## ACADEMIC MINORS

Academic minors are designed to encourage and reward intellectual curiosity by allowing cadets to pursue an area of interest beyond their chosen major. Academic minors are not a USMA graduation requirement.

USMA offers a variety of academic minors that focus on: (1) depth-of-study that is not quite as intensive as a major in the discipline, (2) depth-of-study in a field that is not offered as a major, or (3) interdisciplinary knowledge and skills in a field of study that warrants this approach.

The following guidelines apply to academic minors:

- An Academic Minor consists of a minimum of five academic courses of 3.0 credit hours or higher.
- In pursuing a major and one or more minors, a cadet must meet all curricular requirements for the major and each minor. Double-counting practices (counting one course to meet a course requirement in two different curricular components [e.g., core curriculum and a minor, two minors, a major and a minor]) are permitted. However, for any given cadet, at least three courses of at least 3.0 credit hours in any academic minor must be unique to that minor to gain official recognition.
- A department counselor in the academic minor must grant approval for all double counting requests.
- The graduation transcript will reflect all minors that have been satisfied.
- Cadets are warned that USMA will not guarantee that they will be able to complete a minor, even though the cadet may have already completed courses towards that goal. Scheduling and resource constraints may prohibit availability of the courses.

## GRADING PHILOSOPHY AND GRADING POLICIES

As a critical and essential part of the educational philosophy, it is important to articulate explicitly the Dean's academic grading policies and philosophies. The Dean's policies are described in Dean's Policy and Operating Memoranda (DPOMs) and are located in a folder on the Dean's SharePoint page, which is restricted to internal use only by applicable faculty and cadets.

### *Grading Philosophy*

The foundation of USMA faculty's grading philosophy is a commitment to evaluate cadets based on their achievement of announced course outcomes. Satisfactory performance on graded course requirements must therefore reflect satisfactory progress toward meeting course outcomes. USMA faculty establish reasonable academic standards of achievement in advance of cadets taking a course and taking tests. Their goal is not to rank order cadets against each other based on any preconceived concept of an appropriate grade distribution (curving). Instead, they challenge cadets to meet announced standards of performance and assign grades based on their success in doing so. The principal responsibility for academic performance rests with each individual cadet.

### *Grading Policies*

- Instructors are responsible for providing sound instruction, measurement of cadet attainment, and a reasonable amount of additional assistance. Instructors shall strive to motivate and inspire cadets to achieve their full academic potential. Beyond these obligations, the responsibility for academic success or failure rests with each cadet.
- Instructors will provide cadets with a statement of the outcomes for each course. Cadets will be evaluated against these outcomes. Departments will avoid evaluation and grading practices that encourage reliance on curving.
- However compiled numerically, letter grades ranging from A+ to F will be the standard means of communicating academic achievement.
- Instructors will promptly provide cadets an evaluation of each graded course requirement; the evaluation will be a letter grade or a numerical score easily convertible by the cadet to a letter grade.

For more information on these or other grading policies, please refer to DPOM 02-01, Gradekeeping.

## Examinations

- **Written Partial Review (WPR):** This examination is designed to test knowledge of course material covering specified lessons. Each department will determine the material to be covered, the time of the exam, and the weight of the exam. Written Partial Reviews may be scheduled during normal class meetings, during Dean's Hour, or during Dean's exam periods. Cadets having more than one major graded requirement due the same day (more than two requirements for First and Second Class cadets) may request permission to attend an examination on an alternate day. Responsibility for seeking relief rests with the cadet, while the faculty role is one of cooperation in granting permission where reasonably feasible. Relief must be sought at least 72 hours in advance of the scheduled examination.
- **Term End Examinations (TEE):** These examinations, given at the end of the term, test cadets' knowledge of course material presented during that term. At the request of Course Directors, Department Heads may approve of a TEE exemption for a course. The Dean's office will schedule the TEE for each course without a TEE exemption and every cadet will take the TEE in accordance with the established schedule. Cadets who want to change their TEE date must request the change through AARS as individual instructors are not authorized to make this change.

For more information on course examinations, please refer to DPOM 02-03, Classroom and Related Departmental Procedures.

## Grading

In general, the academic departments describe the relative weight of their graded course requirements in terms of marks (points). Graded course requirements include, but are not limited to, daily writs, WPR, research papers, computer exercises, and TEE. Early in each course, each instructor should provide a list of the course requirements and their weights. Because there is no standard scale used by all departments for converting marks to grades, cadets should ascertain from their instructors during the first few lessons of each term how the various departments assign grades.

Cadets can view a report of their grades online at least four times during each term. The first three reports are interim or progress reports. They are provided after the sixth, tenth, and fifteenth weeks of the term. The fourth report reflects final grades, average for the term, and cumulative average. Copies of the report are available in the Academic Affairs and Registrar Services (AARS), Office of the Dean, during the summer.

After TEE's have been graded, department heads assign final course grades using the A+ to F scale. These final course grades are assigned quality points in accordance with the following table:

| Letter Grade | Quality Points | Letter Grade | Quality Points | Letter Grade | Quality Points |
|--------------|----------------|--------------|----------------|--------------|----------------|
| A+           | 4.33           | B            | 3.00           | C-           | 1.67           |
| A            | 4.00           | B-           | 2.67           | D            | 1.00           |
| A-           | 3.67           | C+           | 2.33           | F            | 0.00           |
| B+           | 3.33           | C            | 2.00           |              |                |

Should a cadet resign or be separated during the term before the first TEE, his or her transcript for all courses will reflect a grade of W (Withdrawn) with no credit awarded. Once the TEE cycle begins, cadets will receive a grade in every course in which they are enrolled.

## ACADEMIC STANDARDS

The primary responsibility for attaining satisfactory academic performance rests with the individual cadet. Cadets must strive to achieve their highest level of academic excellence. To meet this responsibility, cadets have an obligation to know their academic status, manage their time, and establish priorities in such a manner as to accomplish this goal. The performance of academic duties is a significant part of the process of preparing for the acceptance of the duties and responsibilities of Army officers. The standard for performance of academic duties is the same as that for the performance of officer duties--excellence and one's personal best.

Cadets must achieve a grade of D or better in all required academic (core and academic major), military science, and physical education courses. Grades of NC (no credit) may be awarded temporarily, but cadets must resolve the

circumstances that resulted in the NC and be awarded a letter grade in order to receive credit for the course.

The Academic Board will consider the cases of all cadets who are recommended by a Department Head as deficient in a course. If the failed course is required by the cadet's academic program, the course must be repeated in order to receive credit. Cadets may elect to repeat a course in which a grade of "D" was earned if their Academic Program Score (APSC) or Cumulative Quality Point Average (CQPA) is less than 2.00. Departments may make a request for an exception to the APSC/CQPA criteria as long as the request is coordinated with AARS and is approved by the department providing the repeated course. When cadets repeat a course, the original course with the grade earned will always remain on the transcript in the semester taken, as this was the historical record of events. A second entry is made for the same course in the term in which it is repeated and the appropriate grade shown. The grade in the course taken earlier must be a "D" or "F" and the latter grade earned will be used to compute the cadet's APSC/CQPA. The APSC/CQPA in subsequent terms is also adjusted. Refer to DPOM 02-01, Gradekeeping.

If a cadet is deficient in a course, the Academic Board may offer a reexamination in that subject as one course of action. Cadets who accept the reexamination will receive additional guidance from the Registrar's office regarding scheduling and expectations. The reexamination shall occur within 60 days of the date of application. Cadets who fail the reexamination may not have another examination and their separation will be finalized. The Academic Board will consider the cases of all cadets who pass the reexamination to determine whether they are otherwise qualified for readmission to the Academy. Passing the reexamination does not remedy the course failure. Cadets readmitted under these procedures will normally repeat the failed course, if it is required. Refer to DPOM 02-02, End of Term Procedures.

### ***Minimum Quality Point Averages***

In addition to passing each required course, cadets must achieve a minimum CQPA of 2.00 in order to graduate. In order to monitor progress in the Academic Program and to signal substandard achievement, the Academic Board has established performance standards based on APS term (APST) and APS cumulative (APSC). The following table presents the minimally acceptable standards (also referred to as Program Evaluative Goals or PEG points) based on APS. Cadets with averages below those stated will be considered deficient in the Academic Program and will be reported to the Academic Board at the end of each term.

### **MINIMALLY ACCEPTABLE APS:**

| <b>CLASS YEAR</b> | <b>TERM</b> | <b>APST</b> | <b>APSC</b> |
|-------------------|-------------|-------------|-------------|
| <b>Fourth</b>     | First Term  | 1.67        | N/A         |
|                   | Second Term | 1.67        | 1.70        |
|                   | STAP        | N/A         | 1.70        |
| <b>Third</b>      | First Term  | 1.67        | 1.80        |
|                   | Second Term | 1.67        | 1.90        |
|                   | STAP        | N/A         | 1.90        |
| <b>Second</b>     | First Term  | 1.67        | 1.95        |
|                   | Second Term | 1.67        | 1.95        |
|                   | STAP        | N/A         | 1.95        |
| <b>First</b>      | First Term  | 1.67        | 2.00        |
|                   | Second Term | 1.67        | 2.00        |
|                   | STAP        | N/A         | 2.00        |

The APST is based on grades in all courses taken during a semester excluding Military Science and Physical Education. The APSC is based on grades in all courses previously taken at the Academy (excluding Military Science and Physical Education) except that grades in repeated courses replace prior grades of D and F.

## **ACADEMIC DEFICIENCIES AND PROBATION**

Cadets who fall below the APSC levels shown in the table for the applicable semester will be reported deficient in the Academic Program to the Academic Board at term end. Cadets deficient in APSC may be considered by the Academic Board for separation for failure to attain minimum standards in the Academic Program.

Cadets deficient in APSC who are retained at the Academy will be placed on academic probation for the following term. Cadets whose APST is below 1.67 will also be placed on academic probation for the following term. Cadets are removed from academic probation at the end of the next term in which both their cumulative and term averages exceed the peg points in the table. Grades earned in the Summer Term Academic Program (STAP) may raise the APSC above the required peg point and remove a cadet from probation. In order to be removed from academic probation for term performance (APST failure), however, cadets must achieve better than a 1.67 in a full academic term (16 weeks).

A cadet placed on academic probation is subject to the following measures during the probationary period:

- Mandatory counseling by an assigned academic counselor within two weeks of the start of the current term. Performance reviews following the tenth- and fifteenth-week grade reports.
- Mandatory review of chain of command duties by the company tactical officer with a view toward reducing time requirements IAW Annex A, USMA Reg 1-1 (Administrative Scheduling Activities) and the Academy Schedule.
- Assessed room tours in lieu of area tours, except in cases of Class 1 offenses.
- Subject to reduced privileges which are reviewed monthly relative to progress and adjustment.
- Limited to participation in one extracurricular activity or Corps Squad sport at a time. This will be reviewed monthly and follow the guidelines in the Academy Schedule.
- Ineligible to participate in events which involve the loss of academic time, either class or evening study period (e.g., away trip sections, spectator at home athletic contests, extracurricular activity events [Director of Cadet Activities (DCA) and religious trips], voluntary lectures or films, Cadet Public Relations Council (CPRC), conferences etc.), except for participation in the one extracurricular activity provided for above. Participation in a mandatory educational trip that is required for a course is permitted.
- Not authorized to use the following facilities during evening study period: day room, post movie, and Eisenhower Hall (except to attend mandatory lectures).
- A cadet's privileges may be withdrawn by the company tactical officer upon the request of an instructor if both agree that this course of action is essential to improve the cadet's grades.

## ACADEMIC INDIVIDUAL ADVANCED DEVELOPMENT (AIAD)

The purpose of an AIAD is to provide a venue for educational experiences that would not be possible within the usual framework of academic, military, and physical programs that comprise the 47-month USMA experience.

An AIAD is an activity offered by the U.S. Military Academy that is:

- Governed by DPOM 06-02: Academic Individual Advanced Development.
- An experiential program of learning.
- The only duty of the cadet during the experience.
- An immersive experience in an environment different from that encountered by cadets during their normal participation in the academic, military, and physical programs of the USMA.
- Offered to cadets through Academic Departments, or other agencies authorized to do so by the Dean.
- AIADs fulfill the cadet IAD graduation requirement.

An AIAD may offer credit recorded on the USMA transcript. AIADs offering academic credit comply with existing administrative standards contained in Dean's Policy and Operating Memorandums (DPOM 02-01, MADN-OPS-ARS, subject: Gradekeeping and DPOM 02-08, MADN-OPS-ARS, subject: Academic Administration), and undergo review by the Curriculum Committee.

For practical purposes, therefore, an AIAD offering academic credit will be treated as a course and Departmental proposals will be made IAW DPOM 05-05, MADN-OPS-ARS, subject: Managing Curricular Change, and guidance provided by the Dean of the Academic Board.

## STUDY ABROAD

West Point's Study Abroad Program (SAP) is, primarily, a language-based program, open to all cadets. Applications for SAP are normally solicited through the Cadet Information System in September or October of each year. Cadets may spend no more than one semester away from the Academy. Host institutions are chosen for their ability to provide language training and education on other subject matters in a secure environment. For locations where English is not

the primary language, cadets are chosen based on their ability to be successful at the university-level in a foreign language taught at West Point. Additional selection criteria include:

- Must be a Second Class cadet during semester of execution;
- LX371 completion or equivalent minimum proficiency in target language (if applicable);
- Minimum cumulative scores of 2.5 in Academic, Physical, and Military Programs;
- Concurrence of TAC Team, BTO, and DAC;
- No Military Development “D’s” or Fails;
- No un-remediated Indoor/Outdoor Obstacle Course Test (IOCT) failure;
- No Regimental or higher disciplinary actions;
- Not enrolled in the Army Weight Control Program;
- Demonstrated maturity to represent USMA in unsupervised conditions;
- 8TAP compatibility.

Final selections are based on a combination of factors that include funding, the number of slots available at partner institutions, 8TAP compatibility, and demonstrated language proficiency. During Study Abroad, cadets must take the equivalent of five USMA courses, three of which must be courses taught in the host institution’s native language. Additionally, course loads must be chosen to ensure there is no impact to on “on-time” graduation.

Cadets interested in participating are encouraged to contact the Department of English and World Languages (DEWL).

## SERVICE ACADEMY EXCHANGE PROGRAM (SAEP)

USMA Cadets wishing to attend other U.S. Service Academics may apply to spend one semester away from USMA on the Service Academy Exchange Program (SAEP). The process starts with an application through the United States Corps of Cadets (USCC) Leader Development Branch (LBD) in January of yearling year. Typically, the LBD will send an email to all eligible cadets with an application form. To be eligible, a yearling must have at least a 3.0 in each pillar (APSC, PPSC, MPSC).

## ACADEMIC ASSISTANCE

Each academic department offers important supplementary programs and assistance to give cadets specific guidance in academic matters. This guidance assists cadets in overcoming academic weaknesses and in exploiting academic strengths.

**Additional Instruction (AI):** Departments are encouraged to arrange times for AI that are mutually agreeable to cadets and the department. It is the responsibility of each cadet to request additional instruction. Specific guidance on AI hours and procedures will be provided by each department. Refer to DPOM 02-03, Classroom and Related Departmental Procedures.

**Academic Counseling:** The Academic Affairs and Registrar Services (AARS), Office of the Dean, coordinates the faculty-based academic counseling programs available to each cadet. Within the Counseling Branch there are counselors available during normal working hours on a walk-in basis. They can discuss elective choices, schedules, course changes, and overloads and can affect any changes in a cadet’s program. One volunteer faculty member serves as a Company Academic Counselor (CAC) for each company and can help cadets on most academic matters or make referrals to the proper authority in the Dean’s Office or academic departments. In addition, the CAC’s have formal academic counseling responsibility for all cadets in each company who have not yet selected a major. Upon selection of a major, cadets are assigned to the Department Academic Counselors (DAC) of the appropriate academic department. Finally, within the cadet chain of command there are a Cadet Company Academic Officer and an Academic Sergeant who can advise on the grading system, company tutors, additional instruction, and other matters.

## ACADEMIC SUPPORT PROGRAMS

**The Moulner Writing Center:** Located on the second floor of Jefferson Hall, the Moulner Writing Center (MWC) sponsors one-on-one consultations, group workshops, and special events for all cadets working on writing and communications projects for any academic course, personal interest, or professional opportunity.

**Center For Enhanced Performance (CEP):** The CEP helps cadets achieve excellence in the Academy’s three pillars — academic, physical, and military — through targeted education and training on specific strategies and intangible mental skills that underlie improved human performance.

- **Peak Performance Program (PPP):** This is offered to all cadets who wish to enhance their academic, athletic, and military performance through psychological and mental skills training. The goal is for the cadet to gain the ability to maximize their potential in any situation especially under pressure and stress. A variety of skills are taught including effective thinking, focus and concentration, visualization and imagery, and team building. Individual sessions are scheduled with the cadet and a performance enhancement trainer. Sessions may also utilize the **Mental Training Lab** to further improve performance.
- **Academic Excellence Program (AEP):** This program is dedicated to fostering student success through personalized support services. AEP offers tutoring, concussion recovery assistance, individualized academic support, scholarship advising, and guidance on major selection, all delivered through one-on-one appointments. Additionally, AEP provides resources and support for students on academic probation to help them get back on track. This program is committed to helping every cadet achieve their academic and military goals.
- **Athletic Academic Success Coordinator (AASC Program):** AASCs provide dedicated support exclusively for Corps Squad Athletes. Utilizing an intrusive counseling style, they focus on enhancing time management, organization, and test preparation. They also help athletes adjust to the rigors of academy life. Through personalized guidance, they ensure that student-athletes can balance their academic and athletic commitments effectively. This program is designed to foster academic success and personal growth for our athletes.
- **Student Success Course (RS101):** This credit-producing course is designed to improve cadet academic, and leadership performance at USMA. Mastery of a variety of strategies leads to this goal. Strategies presented include effective thinking, goal setting, time management, concentration, test taking, and note taking. The strategies mastered are implemented immediately into the cadet's present life at USMA and contribute to life-long learning. The course has five graded assignments and a final pass/no record grade determination.
- **Reading Efficiency (RS102):** This course develops flexible reading strategies. Increasing one's base reading rate while maintaining comprehension is accomplished through the use of computer programs, textbook reading and recreational reading. Various pacing techniques and supervised practice lead to the increase of both reading rate and comprehension.
- **Information Literacy and Critical Thinking (RS103):** This course is designed to improve cadet analytical and intellectual performance at USMA. Mastery of a variety of strategies leads to this goal. Strategies presented include: utilizing critical thinking models, understanding the research process, and evaluation of information sources. The strategies mastered yield short term academic benefits and long-term professional disciplines. The course has four graded assignments and a final pass/no-credit grade determination.
- **Introduction to Performance Psychology (RS104):** This course introduces cadets to the essential principles and skills of performance psychology and provides a framework through which these principles can be applied toward the pursuit of academic, athletic, and military excellence. Cognitive skills for confidence development, attention control methods, relaxation techniques, and imagery are taught and practiced. A detailed personal goal setting plan is completed by the course's end.
- **First Year and Beyond (FYB) Program:** The FYB program is intended to assist select cadets who, based on their performance after 6-week grades in first-term academic courses, are having difficulty adapting to the rigors of the academic program. In addition to the immediate relief and assistance provided during the first term, FYB helps these cadets develop as self-directed learners by continuing to provide educational scaffolding as they move beyond their initial academic term. This scaffolding is deliberately reduced over the cadets' 47-month experience. Please see a CEP counselor to learn more about the FYB program.

## ACADEMIC AWARDS AND RECOGNITION

Excellence in academic pursuits has long been the measure of an individual's self-discipline and self-growth. Recognition of excellence has been the keystone of West Point's educational philosophy for over 200 years. The academic excellence of cadets is recognized throughout their four years at the Military Academy and is expressed in more than 100 awards. Just as such awards reflect an individual commitment to academic excellence in undergraduate study, they also reflect a strong foundation for graduate and post graduate work.

Details on criteria for our awards programs, including Latin Honors, Distinguished Cadets and Superintendent's Award can be found in USMA Regulation 672-2. Dean's List, also explained in USMA Regulation 672-2, is a designation for a cadet with a Term Quality Grade Point Average (TQPA) of 3.0 or greater, considering all academic courses taken during the semester, as well as military science and physical education courses.

**Dean's Company Award:** The Dean's Company Award recognizes academic achievement by a company during the fall and spring terms. Performance in the academic program is determined by the average of the term Academic Program Score (APS) of all cadets in the company. The company with the highest average APS in each regiment receives a gold streamer to be attached to the company guidon. A silver streamer is awarded to any company with a company with an average APS of 3.0 or higher.

## SCHOLARSHIPS AND FELLOWSHIPS

Cadets are encouraged to compete for a number of nationally recognized graduate scholarships and fellowships. The West Point Scholars Program (WPSP) serves four main functions: provide advanced development for cadets, provide intellectual capital to the Army, strengthen partnerships, and bridge the civ-mil divide, and provide strategic recruitment benefit to the Academy. The WPSP Support Cell consists of the Deputy Registrar, who serves as the Primary Executive on behalf of the Dean and under the supervision of the Vice Dean for Operations, the Head Academic Advisor, and the Medical School Advisor. All cadet applications are screened and managed by the executive agent for each scholarship program listed below. Executive agents are academic departments that are selected by the Dean of the Academic Board to house and supervise individual scholarship programs. Each executive agent maintains their own approval process in accordance with the WPSP SOP. The Academic Board will approve the list of applicants. West Point will only sponsor cadets approved through the executive agents. Refer to DPOM 06-03, West Point Scholars Program, for more information.

## GRADUATE SCHOOLING

### ADMINISTRATIVE INFORMATION

**Transcripts:** Permission must be given in writing by the cadet (or former cadet) before transcripts will be released. Transcripts of academic records are available at Academic Affairs and Registrar Services (AARS), Office of the Dean.

**Academic Evaluations:** Upon request, faculty members will provide cadets with academic evaluations using USMA Form 3-230 which is available in the Office of the Dean. These forms permit the Office of the Dean with a cadet's authorization under the provisions of the Privacy Act to provide selected information to designated institutions, agencies, or individuals. In most cases, the Office of the Dean will use these forms and other information in the cadet file as a basis for an official assessment of graduate school potential. Cadets are encouraged to seek academic evaluation by instructors during the Second and First Class years.

**Qualifying Examinations:** Most graduate or professional schools require that prospective students report their score on a nationally recognized qualifying examination before acceptance is granted. Cadets are responsible for arranging to take any of the examinations which may be required for admission to a graduate or professional program.

### GRADUATE SCHOOLING OPPORTUNITIES

**Medical School (West Point Pre-Medical Scholarship Program):** In accordance with Army Regulation (AR) 601-141, the Department of Defense permits up to 3% of cadets from each West Point graduating class to attend medical school under military sponsorship.

The Superintendent is responsible for the selection of cadet applicants for the Uniformed Services University (USU) and Health Professions Scholarship Program (HPSP). The management of this process is accomplished through the West Point Pre-Medical Scholarship Program, coordinated by a health professions advisor in the Office of the Dean in concert with faculty from the Department of Chemical and Biological Science and Engineering (CBSE).

The Association of American Medical Colleges (AAMC) governs the medical school application process for allopathic schools in the United States and Canada. The seventeen core competencies prescribed by the AAMC include proficiency in pre-professional activities, thinking and reasoning, and science competencies. Cadets demonstrate aptitude in these areas through academic success, performance on the Medical College Admission Test® (MCAT), clinical exposure, research, volunteer work and community service. In addition to meeting program requirements, cadets must perform well in the three pillars of academy life: academic, military, and physical. Core competencies and minimum program requirements are listed below.

## AAMC Core Competencies

### Pre-professional Activities      Thinking and Reasoning      Science Competencies

- |                                          |                         |                 |
|------------------------------------------|-------------------------|-----------------|
| -Commitment to learning and growth       | -Critical thinking      | -Human behavior |
| -Cultural awareness                      | -Quantitative reasoning | -Living systems |
| -Cultural humility                       | -Scientific inquiry     |                 |
| -Empathy & compassion                    | -Written communication  |                 |
| -Ethical responsibility to self & others |                         |                 |
| -Interpersonal skills                    |                         |                 |
| -Oral communication                      |                         |                 |
| -Reliability & dependability             |                         |                 |
| -Resilience & adaptability               |                         |                 |
| -Service orientation                     |                         |                 |
| -Teamwork & collaboration                |                         |                 |

## Pre-Medical Program Requirements

- Cumulative Grade Point Average (CQPA)  $\geq 3.2$
- Biology-Chemistry-Physics-Math (BCPM) average  $\geq 3.2$
- MCAT score  $\geq 500$
- MCAT section scores  $\geq 124$
- Significant clinical exposure (target 200 hours of healthcare volunteer work and shadowing)
- Participation in research
- Selfless service demonstrated by volunteer activities and community work

Cadets may enter the program through any major; however, only cadets in CBSE majors are guaranteed seats in the pre-requisite classes. The pre-medical program course guidelines are listed below. Undergraduate course requirements for medical schools vary and cadets are strongly encouraged to explore specific recommendations for their schools of interest. For example, a medical school may require an upper-level science class like genetics that is not included in the USMA guidelines. When pre-medical courses are oversubscribed, the final determination for admission will be made by the CBSE department with input from the health professions advisor in the Office of the Dean. Factors for consideration will include major, commitment to the pre-medical program, participation in the West Point Pre-Medical Society (WPPMS), progress in meeting program requirements, and reaching Academic Program Score Cumulative (APSC) PEG points for each course. The USMA course recommendations and PEG points are as follows:

| <b>USMA Course Requirements</b>         | <b>APSC PEG point</b> |
|-----------------------------------------|-----------------------|
| General chemistry with lab — 1 year     | N/A                   |
| Organic chemistry with lab — 1 year     | 3.0                   |
| Biochemistry — 1 semester               | 3.2                   |
| Biology with lab — 1 semester           | 3.0                   |
| Physiology with lab — 1 semester        | 3.2                   |
| Physics with lab — 1 year               | N/A                   |
| Calculus — 1 semester                   | N/A                   |
| Probability and statistics — 1 semester | N/A                   |
| English — 1 year                        | N/A                   |

Applicants typically apply to many medical schools (15 or more). Omitting courses from the recommended list may limit one's options and compromise opportunities to attend medical school. Cadets who validate required courses (examples: CH101 and CH102) are strongly encouraged to check the guidelines of the medical schools where they plan to apply. Some institutions will not accept the validations, and most schools that accept credit want to see that applicants have pursued a higher-level course for the validated class (example: physical chemistry for cadets who validate inorganic chemistry).

The West Point Pre-Medical Society (WPPMS) provides opportunities for cadets to share interests, attend talks by guest speakers, join in volunteer experiences, and pursue leadership positions. This cadet run club operates under the auspices of a faculty member in the CBSE department in close coordination with the USMA health professions advisor. It is imperative that all pre-med cadets join the WPPMS. Since cadets enter the pre-med scholarship program through a variety of majors, the WPPMS serves as the primary conduit for information flow. All important events are coordinated through the pre-med society, ranging from briefings regarding the medical school program and shadowing opportunities to MCAT preparation and selection by the Medical Program Advisory Committee (MPAC).

Endorsement to attend medical school directly from West Point is made by the MPAC. This multidisciplinary group includes representatives from Keller Army Community Hospital, CBSE, Uniformed Services University, USCC, and the Dean's staff. Formal applications are submitted in the spring of second-class year. The committee meets in April and selects up to three percent of the cadets as primary endorsees. Additional alternates may be selected. Initial selections are provisional pending final second semester grades and MCAT scores. Cadets are required to take the MCAT no later than mid-June and must meet the GPA and MCAT requirements of the program (3.2 GPA, 500 MCAT, 124 section scores) to receive final endorsement. These cadets receive a committee letter written by the health professions advisor for inclusion in their medical school applications.

Once accepted, cadets are fully funded to attend medical school. They may attend the Uniformed Services University (USU) or any civilian medical school in the United States. Students at civilian schools receive funding through the Health Professions Scholarship Program (HPSP).

Please direct any questions to the health professions advisor in the Office of the Dean.

**Other Graduate School Opportunities:** Other graduate school opportunities may be available to cadets in specific disciplines and branches. Please see the appropriate Department Academic Counselors and branch representatives to learn more.

# **PART I: THE ACADEMIC PROGRAM - CLASS GRADUATION REQUIREMENTS**

OFFICE OF THE SUPERINTENDENT  
UNITED STATES MILITARY ACADEMY  
WEST POINT, NEW YORK 10996-1602

MADN-ARS

JAN 12 2021

MEMORANDUM FOR SEE DISTRIBUTION

SUBJECT: Class of 2024 - 2026 Minimum Graduation Requirements

1. **Purpose:** This document articulates the minimum requirements that each Cadet must meet to graduate from the United States Military Academy (USMA).

2. **Discussion:**

The United States Military Academy educates, trains, and inspires cadets across a core set of developmental experiences in the academic, military, physical, and character programs, collectively known as the West Point Leadership Development System (WPLDS). The WPLDS is designed to produce graduates who:

- *Live honorably*
- *Lead honorably*
- *Demonstrate excellence*

To assess if a cadet has demonstrated the minimum virtues and merit expected of a USMA graduate and future US Army officer, USMA's minimum graduation requirements are published below. Note that cadets must always aspire to far exceed these minimum standards, both individually and collectively.

3. **Minimum Requirements:**

a. **Institutional:**

- (1) Achieve a Cumulative Quality Point Average (CQPA) of 2.00.
- (2) Complete a minimum of eight semesters as a full-time cadet, either at the Academy or as a part of an Academic Board-sanctioned semester exchange program.
- (3) Successfully complete the USMA core curriculum in the academic, military, physical, and character programs as defined in the Red Book, Green Book, White Book, and Gold Book, respectively. Also, achieve an Academic Program Score Cumulative (APSC), Military Program Score Cumulative (MPSC), and Physical Program Score Cumulative (PPSC) each of 2.00 or greater.

(4) Successfully complete one of the following broadening experiences: A Military Individual Advanced Development (MIAD), a Physical Individual Advanced Development (PIAD), or an Academic Individual Advanced Development (AIAD).

(5) Meet the Army body composition standards of Army Regulation 600-9 (Army Body Composition Program).

(6) Meet the Army physical readiness requirements.

b. Academic Program: Satisfy the requirements of at least one academic major.

c. Military Program:

(1) Successfully complete Cadet Basic Training (CBT), Cadet Field Training (CFT), and Cadet Leader Development Training (CLDT).

(2) Successfully complete Drill Cadet Leader Training (DCLT), Cadet Troop Leader Training (CTLT), or an Academic Board-approved constructive credit experience.

(3) Successfully complete a West Point summer leader detail during second or first-class summer.

d. Physical Program: Successfully complete the Indoor Obstacle Course Test (IOCT) during the second or first-class year.

e. Character Program:

(1) Abide by the Cadet Honor Code. If a cadet is found to have violated the code and is retained, he/she is required to successfully complete a prescribed remediation program.

(2) Abide by the standards of conduct and respect for others. If a cadet violates these standards and is retained, he/she is required to successfully complete a prescribed remediation program.

4. The Academic Board approved these minimum graduation requirements on 22 October 2020.

MEMORANDUM FOR SEE DISTRIBUTION

SUBJECT: Addendum, Class of 2024 - 2026 Minimum Graduation Requirements

1. **Purpose:** This document articulates one addendum to HQ USMA, MADN, memorandum (Class of 2024 - 2026 Minimum Graduation Requirements), originally recommended for approval by the Academic Board on 22 October 2020 and subsequently approved by the Superintendent, LTG Darryl A. Williams.

2. **Addendum - Institutional:** Para 3.a.(6) has been modified to add one requirement regarding the Army Combat Fitness Test (ACFT). The full requirement should read:

(6) Meet the Army physical readiness requirements and pass the ACFT within 120 days before graduation.

3. **Addendum - Academic:** Para 3.b. has been modified to add the following sentence: "Cadets may not have unresolved course failures during their final term." The full requirement should now read:

(1) Satisfy the requirements of at least one academic major.

(2) Cadets may not have unresolved course failures during their final term.

4. The Academic Board recommended approval of these addenda on 14 April 2022 (Academic Program) and 03 August 2022 (Institutional) starting with the Class of 2024.

# **PART I: THE ACADEMIC PROGRAM - CPS CALCULATION**

## **1. Computing the CPS.**

The CPS is computed in a way that provides a measure of a cadet's performance relative to his or her peers. This is meant to adjust for variations in grading systems within and among the three programs.

- a. The APSC, MPSC, and PPSC are standardized so they each have a mean of zero and standard deviation of one.

$$APS^* = \frac{APSC - APSC_{Class\ Mean}}{\sigma_{APSC}}$$

$$MPS^* = \frac{MPSC - MPSC_{Class\ Mean}}{\sigma_{MPSC}}$$

$$PPS^* = \frac{PPSC - PPSC_{Class\ Mean}}{\sigma_{PPSC}}$$

where  $\sigma_{APSC}$ ,  $\sigma_{MPSC}$ ,  $\sigma_{PPSC}$  are the standard deviations of the class's respective scores.

- b. Standardizing the APSC, MPSC, and PPSC ensures that all cadets are evaluated based on their performance relative to their class. It accounts for the deviation of their score from the class average (mean) score. It rewards those who are further above the mean and penalizes those who are further below the mean.

- c. Standardizing does affect determination of Honor Graduates ( $CPS \geq 3.50$ ). This award is meant to be given to cadets based on their performance relative to their peers, not based on an absolute number. Normalizing ensures that only those cadets who truly performed significantly better than their peers become the honor graduates.

- d. The CPS is based on the weighted average of the cumulative program scores. The APSC contributes 55%, the MPSC contributes 30%, and the PPSC contributes 15%.

$$CPS^* = 0.55(APS^*) + 0.30(MPS^*) + 0.15(PPS^*)$$

- e. The weighted average of the standardized program scores,  $CPS^*$ , is a normally-distributed random variable with a mean equal to zero. To calculate a representative score on a 4.0 scale,  $CPS^*$  is standardized as follows (Z is the number of standard deviations above or below the class average):

$$Z = \frac{CPS^* - 0.0}{\sigma_{CPS^*}} = \frac{CPS^*}{\sigma_{CPS^*}}$$

f. Based on this result, the CPS is calculated to conform to a distribution with a mean of 2.8 and standard deviation of 0.40:

$$CPS = 0.40Z + 2.80$$

Using this mean and standard deviation ensures that 95% of cadets will have a CPS between 2.0 and 3.6 and 99.7% will be between 1.6 and 4.0. The top 4% of the class will have a  $CPS \geq 3.5$  and be designated as *Honor Graduates*.

## 2. Examples.

To illustrate why the program scores must be standardized, consider the following examples. Suppose the following situation exists:

| Program scores |            |                          |         |         |
|----------------|------------|--------------------------|---------|---------|
|                | Class Mean | Class Standard Deviation | Cadet A | Cadet B |
| APS            | 3.006      | .513                     | 3.006   | 3.326   |
| MPS            | 3.017      | .423                     | 3.017   | 2.878   |
| PPS            | 3.063      | .340                     | 3.063   | 3.454   |

a. **Example 1.** Cadet A is clearly average since his/her program scores are the same as the graduating class' program score averages. Without standardizing, Cadet A's CPS would be

$$CPS = .55(3.006) + .30(3.017) + .15(3.063) = 3.02$$

Cadet A's CPS should be the CPS class mean. In this case, it won't be because each program score has a different standard deviation. Without standardizing, the MPSC and PPSC scores were allowed to carry more weight than intended and allowed Cadet A to be considered above average. Cadet A's CPS after standardizing the program scores is:

$$CPS^* = .55(0.00) + .30(0.00) + .15(0.00) = 0.00$$

$$CPS = 0.40(0.00) + 2.8 = 2.8$$

In this case, Cadet A's CPS is the class average (mean).

- b. **Example 2.** Cadet B's CPS is computed as follows:

$$APS^* = \frac{3.326 - 3.006}{.513} = 0.624$$

$$MPS^* = \frac{2.878 - 3.017}{.423} = -0.329$$

$$PPS^* = \frac{3.454 - 3.063}{.340} = 1.150$$

$$CPS^* = 0.55(0.624) + 0.30(-0.329) + 0.15(1.150) = 0.417$$

Using each cadet's CPS\*, we can compute and verify that the class mean CPS\* is zero and the standard deviation is 0.825. Cadet B's CPS\* score is 0.417, which is clearly above average. Standardize CPS\* and convert it to the 4.0 scale to find the CPS.

$$Z = \frac{0.417}{0.825} \approx 0.506$$

$$CPS = 0.40(0.506) + 2.80 = 3.002$$

Cadet B is above average ( $3.00 > 2.80$ ).

- c. **Example 3** (Are you really an Honor Graduate?). Suppose the following situation exists:

| Program scores |            |                          |         |
|----------------|------------|--------------------------|---------|
|                | Class Mean | Class Standard Deviation | Cadet C |
| APS            | 3.183      | .597                     | 4.000   |
| MPS            | 3.218      | .404                     | 2.895   |
| PPS            | 3.089      | .280                     | 2.873   |

Cadet C appears to be very bright. Does well academically, but performs below average in the physical and military programs. Determine Cadet C's CPS without standardizing the program scores.

$$CPS = .55(4.000) + .30(2.895) + .15(2.873) = 3.50$$

In this case, Cadet C did so well academically that he/she is considered an Honor Graduate. However, this cadet did not truly perform significantly better than his/her peers. The Graduate Outcome Goal requires cadets to excel in all three programs. Now, compute the actual CPS

$$APS^* = \frac{4.000 - 3.183}{.597} = 1.369$$

$$MPS^* = \frac{2.895 - 3.218}{.404} = -0.800$$

$$PPS^* = \frac{2.873 - 3.089}{.340} = -0.635$$

$$CPS^* = 0.55(1.369) + 0.30(-0.800) + 0.15(-0.635) = 0.418$$

$$Z = \frac{0.418}{0.825} \approx 0.507$$

$$CPS = 0.40(0.507) + 2.80 = 3.00$$

Cadet C is above average ( $3.00 > 2.80$ ), but not worthy of being an Honor Graduate.

# **PART I: THE ACADEMIC PROGRAM - STUDY OF WAR THREAD**

## Study of War Thread in the Academic Program United States Military Academy

The Study of War Thread (SoWT) is a multi-disciplinary effort embedded within the core Academic Program that fosters cadets' intellectual understanding of war as a human phenomenon. This knowledge increases the effectiveness of platoon and company operations, enhances officers' understanding of the strategic and moral context of warfare, and provides a foundation for life-long learning for the Academy's graduates throughout their careers as military professionals.

An effective study of war must be a multi-disciplinary effort, as recognized by LTG (Ret.) H. R. McMaster in an external assessment of the West Point curriculum:

*"In general, the study of war and warfare across the curriculum at West Point might best be approached consistent with Sir Michael Howard's 1961 essay on how military professionals should develop their own theory or understanding of war and warfare. First, to study in width. To observe how warfare has developed over a long historical period. Next, to study in depth. To study campaigns and explore them thoroughly, consulting original sources and applying various theories and interdisciplinary approaches ... And lastly, to study in context. Wars must be understood in their social, cultural, economic, human, moral, political, and psychological contexts because as Sir Michael observed "the roots of victory and defeat often have to be sought far from the battlefield." History, political science, social science, philosophy, literature, geography, and psychology all contribute to understanding war in context. And a critical element of the study of war in context is the military's role under the Constitution and an understanding of civil-military relations." (H.R. McMaster, "The Need for a Coherent Interdisciplinary Approach to the Study of War and Warfare at West Point," 2012, p. 2)*

One of the six goals for the Military Program at West Point draws from this same source, that graduates must "demonstrate how to critically think about and understand war and warfare in width, depth, and context." (The Military Program (Greenbook), Academic Year 2020, p. 6) The Academic Program plays an integral role in achieving this goal, developing each cadet's intellectual preparation for the rigors and complexity of combat while helping them internalize their professional identity as commissioned officers. Preparing officers to think broadly and deeply about war as military professionals is essential for lethality, readiness, and future service as strategic thinkers and leaders.

### Structure and Courses

The SoWT is organized around the four fields of expertise described in the Army Profession doctrine: military-technical, geo-cultural/political, moral-ethical, and human-leader development. Cadets progress through a series of core courses building expertise in these four areas and then complete a capstone course on Officership that integrates these fields of expertise into a coherent whole. The capstone course emphasizes the officer's role as a warfighter using historical case studies and current scenarios that highlight the platoon warfighting challenges while always considering the strategic context that provides purpose and a moral setting for their lethal actions. Cadets grapple with concepts such as mission command, multi-domain operations, moral leadership in a complex environment, leadership/lethality at the platoon level, and, when needed, disciplined disobedience to illegal or immoral orders.

The following table lists the core courses that make up the Study of War Thread:

Study of War Thread Core-Course Integration

| Officership Domain | 4th Class Yr                      | 3rd Class Yr        |                            | 2nd Class Yr                     |                                      | 1st Class Yr         |
|--------------------|-----------------------------------|---------------------|----------------------------|----------------------------------|--------------------------------------|----------------------|
|                    | HI101<br>The Army of the Republic | PY201<br>Philosophy | SS202<br>American Politics | SS307<br>International Relations | HI302<br>History of the Military Art | MX400<br>Officership |
| Military-Technical | X                                 |                     |                            |                                  | X                                    | X                    |

|                        |   |   |   |   |   |   |
|------------------------|---|---|---|---|---|---|
| Geo-Cultural/Political | X |   | X | X |   | X |
| Moral-Ethical          | X | X |   | X |   | X |
| Human-Leader           | X |   |   |   | X | X |

### Other Participants

In addition to the courses listed above, the thread will serve as an information sharing mechanism for other stakeholders across the Academy. Such stakeholders include faculty teaching other core courses, the academic departments, faculty responsible for academic majors and minors, the Department of Military Instruction, the Brigade Tactical Department, the Modern War Institute, and other research centers. On an annual basis, the thread can serve as a vehicle for developing common situational awareness of what other organizations are contributing to the study of war and warfare at West Point.

### Study of War Lecture Series

The Study of War Thread will include a lecture series that highlights how course-wide lectures complement cadet education on the various aspects of war and warfare. The series will include events such as the annual Class of '52 Distinguished Lecture and the Combating Terrorism Center's annual Yearling lecture. Other annual events relevant to the study of war that are sponsored by different departments and USCC will be considered for inclusion in the lecture series.

### Thread Goals

The Study of War Thread, as part of the broader West Point experience, provides graduates with an understanding of:

- how the military-technical character of warfare has developed over long historical time periods
- the relationship between the armed forces of the United States and the American political system
- the social, cultural, economic, human, moral-ethical, political, and psychological contexts of war and warfare
- the unique moral-ethical and leadership challenges inherent to war and warfare

### Administration and Assessment

The initial co-chairs are Dr. Scott Silverstone (Professor of International Relations and Director of the Grand Strategy Program in the Department of Social Sciences) and Dr. Jeffrey Peterson (Director, Character Integration Advisory Group, Simon Center for Professional Military Ethic). The committee will meet at least twice a year (about March and October) to facilitate communication, mutual support, and to develop and execute an assessment plan. The co-chairs periodically report to the General Committee to receive feedback on the SoWT and to present assessment results, proposals for changing the thread, and any other issues related to the SoWT.

# **PART I: THE ACADEMIC PROGRAM - CHARACTER THREAD**

## **Character Thread in the Academic Program United States Military Academy**

The character thread is a multi-disciplinary effort embedded within the Academic Program's core curriculum that fosters character development through the content and instructional method of academic core courses. The purpose of the character thread is to support USMA's character-development efforts by identifying and reinforcing character connections across eleven academic core courses and enabling integration with the Cadet Character Education Program (CCEP), prevention curriculum, and other character-development activities conducted across USMA. Faculty members teaching courses in the thread will develop a shared understanding of cadets' strengths and opportunities for improvement related to USMA's character development goals as well as the way thread courses support character development.

The character thread comprises *core thread courses* and *supplemental thread courses*. The thread's core courses have course learning outcomes that directly support USMA's character development goals; supplemental courses contain content that supports USMA's character development goals.

Character thread core courses:

- The Army of the Republic: Leading Citizen Soldiers (HI101)
- General Psychology for Leaders (PL100)
- Philosophy & Ethical Reasoning (PY201)
- Military Leadership (PL300)
- Officership (MX400)

Character thread supplemental courses

- Computing Fundamentals (CY105)
- Literature (EN102)
- Physical Geography (EV203)
- American Politics (SS202)
- History of the Military Art (HI302)
- Constitutional & Military Law (LW403)

The character thread is one element of USMA's common character experiences, which include components of the Academic, Military, and Physical Programs along with prevention activities and Academy events (see appendix a). Common character experiences are developmental opportunities designed to prepare cadets to live honorably, lead honorably, and demonstrate excellence. The character thread promotes development both within a given year (e.g., plebe year) by connecting the thread's courses to simultaneous common character experiences and across its eleven academic core courses by reinforcing character-related content.

Character thread courses support USMA's character development goals by:

1. Introducing cadets to the concept of character writ large and within the specific context of service as an Army officer.
2. Teaching cadets to think critically using different disciplinary approaches that are useful in assessing moral dilemmas.
3. Fostering productive discomfort as cadets learn how to navigate complexity, ambiguity, and opposing perspectives.
4. Preparing cadets to critically reflect on, and civilly discuss, urgent issues facing the nation and the world.
5. Modeling and providing opportunities for cadets to demonstrate, and see the benefits of, empathy and emotional intelligence.
6. Modeling, studying examples of, and providing cadets opportunities to exercise intellectual courage and moral strength.
7. Modeling and encouraging intellectual and ethical humility.
8. Providing opportunities for cadets to explore the professional obligations of U.S. Army officers, the nature of the society in which they serve, and what it means to commit to a lifetime of service to the Army and the nation.
9. Providing cadets opportunities for self-discovery and growth.
10. Providing opportunities for cadets to imagine the probable and possible and to identify the implications of those scenarios.

## **Administration**

Directors of core thread courses and supplemental thread courses will participate in thread meetings (three per year) to identify opportunities to reinforce connections and address institutional focus areas across their courses and within a given cadet year. Leaders of common character experiences not within the Academic Program will also be invited to thread meetings. Course directors, and leaders of these common character experiences will share assessments to create a shared understanding of cadets' strengths and opportunities for improvement related to USMA's character-development goals. Thread leaders will produce a document each year that shares course assessments related to USMA's character-development goals, identifies focus areas for the next academic year, and highlights connections made within the thread and with other common character experiences. This document will be informed by course annual executive summaries that include a section on thread contributions that identify new or existing connections with other thread courses or other common character experiences as well as relevant assessment results and character assessments in other programs.

Course directors of core thread courses and supplemental thread courses will share information about the character thread with faculty members teaching thread courses prior to the start of each semester. At a minimum, course directors should share the purpose of the character thread; their course's contributions to the character thread; and the connection of the course's content to other character thread courses, the Cadet Character Education Program (CCEP), prevention curriculum, and other USMA

character-development activities. Syllabi of thread courses will specify that the course is part of the character thread.

The attached appendix depicts USMA's common character experiences (Appendix A).

## Appendix A: Common Character Experiences

|                                                                                                                                        |                                                                                                    |                          |                       |                      |
|----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|--------------------------|-----------------------|----------------------|
|  <b>UNITED STATES MILITARY ACADEMY<br/>WEST POINT</b> | <b>Common Character Experiences</b><br><i>"A common path towards living and leading honorably"</i> |                          |                       |                      |
|                                                                                                                                        | <b>Plebe</b>                                                                                       | <b>Yearling</b>          | <b>Cow</b>            | <b>Firstie</b>       |
|                                                                                                                                        | <b>Followership</b>                                                                                | <b>Lead Your Soldier</b> | <b>Lead the Corps</b> | <b>Lead the Army</b> |
| Cadet Summer Training (CST)                                                                                                            |                                                                                                    |                          |                       |                      |
| AY Commandant's Time                                                                                                                   |                                                                                                    |                          |                       |                      |
| Military Science Sequence                                                                                                              |                                                                                                    |                          |                       |                      |
| Physical Program Sequence                                                                                                              |                                                                                                    |                          |                       |                      |
| Academic Program Sequence (Core)                                                                                                       |                                                                                                    |                          |                       |                      |
| Academic Program Sequence (Supplement)                                                                                                 |                                                                                                    |                          |                       |                      |
| Primary Prevention Plan                                                                                                                |                                                                                                    |                          |                       |                      |
| Academy Traditions                                                                                                                     |                                                                                                    |                          |                       |                      |

|                                                                                                                                          |                                                                                                    |                                                      |                                                 |                                                               |

# **PART II: DISCIPLINARY OFFERINGS**

## PART 2: DISCIPLINARY OFFERINGS

This section of the Academic Program (Redbook) presents descriptions of the academic disciplines and specific learning outcomes of all USMA academic majors. A complete listing of the Military Academy's majors and minors appears in Part 4.

### ACADEMIC DISCIPLINE DESCRIPTIONS

#### Aerospace Engineering Major (AEN0 )

**[DA CD: CFA - AERO-SPACE ENGINEERING-SPACE TRAVEL / CIP CD: 14.0201 - Aerospace, Aeronautical and Astronautical/Space Engineering]**

Aerospace Engineering is one of the newest and most exciting of the engineering fields. It deals with the design and analysis of aerospace systems, which could include fixed and rotary-wing aircraft, spacecraft, satellites, uncrewed aircraft systems, and weapons. In a broader sense, aerospace engineering can be applied in the design and analysis of any system that moves through the air to include ground vehicles, and people. Aerospace engineers are in high demand throughout the technology sector with advances in space exploration, hypersonic weapons, advanced air mobility, and uncrewed aircraft systems take on increasingly important roles for the military and society. All cadets experience the same core aerospace engineering program and choose a path in aeronautical or astronautical courses for a depth of study. The goal of the Aerospace Engineering program is to provide high quality instruction in a positive learning environment leading to a degree recognized as being among the best in the nation. The Aerospace Engineering program stresses engineering fundamentals so that graduates are well equipped to understand complex technical problems in a rapidly changing, technology-intensive Army. Once completed, the graduate is well-prepared to excel as an officer and an engineer. The practice-oriented degree is strengthened by the complete integration of design and laboratory experience throughout the curriculum, to include the unique and highly sought after academic flight laboratory program.

To meet this goal, the Program Educational Objectives of the Aerospace Engineering program are:

Within a few years after graduation, aerospace engineering majors are expected to attain:

1. multiple positions of responsibility in which they:
  - a. solve technological problems
  - b. inform and influence others
  - c. build high-performing teams
2. personal and professional growth through formal and informal learning opportunities while being a role model to inspire others
3. experience in providing engineering expertise to the Army and Nation to design solutions and innovate for winning in a complex world

To achieve these Program Educational Objectives, cadets who qualify for graduation with an aerospace engineering major from USMA will demonstrate the following Aerospace Engineering Student Outcomes:

#### Student Learning Outcome 1

an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics.

#### Student Learning Outcome 2

an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors.

#### Student Learning Outcome 3

an ability to communicate effectively with a range of audiences.

#### Student Learning Outcome 4

an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts.

#### **Student Learning Outcome 5**

an ability to function effectively on a team whose members together provide leadership, create a collaborative environment, establish goals, plan tasks, and meet objectives.

#### **Student Learning Outcome 6**

an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions.

#### **Student Learning Outcome 7**

an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

### **American Politics (PAP3 )**

**[DA CD: ERX - POLITICAL SCIENCE / CIP CD: 45.1002 - American Government and Politics]**

The American Politics program provides students with the ability to explain political outcomes. The program traces the founding and evolution of our American political institutions, emphasizing how philosophical principles influenced the structure and behavior of the nation's governing apparatus. Students receive instruction in political science methods, enabling them to identify and critique methodological approaches to answering political science questions and select an appropriate method of answering their own research questions. Cadets are afforded an opportunity to study contemporary topics in public policy in depth and explain outcomes based on the actions of formal and informal political actors. The American Politics program emphasizes the role of the US military in society, its constitutional roles and responsibilities, and the shifting tenor of civil-military relations across time and levels of policy implementation. Cadets explore the military profession in the context of American political society.

American Politics Student Learning Outcomes and Supporting Objectives:

#### **Student Learning Outcome 1**

Analyze the constitutional origins and historical development of formal institutions (Legislative, Executive, Judicial branches, bureaucracy) and informal actors (media, political parties, interest groups) in American politics.

- a) Identify the fundamental principles of the U.S. Constitution that influence relevant decisions - such as power, conflict, civil rights, and civil liberties - within the American political system.
- b) Examine the political behavior of individuals, actors, and institutions within American politics and the policymaking process.

#### **Student Learning Outcome 2**

Describe the methods by which political scientists research, critically analyze, and explain American politics.

- a) Distinguish research questions appropriate to political science.
- b) Critically evaluate scholarly research based on the merits of research design.
- c) Apply the scientific method using qualitative, quantitative, or experimental methods.
- d) Demonstrate the ability to communicate ideas and provide critical evaluation clearly and effectively.
- e) Demonstrate an appreciation for intellectual pluralism by applying more than one theoretical perspective to a particular phenomenon and assessing the relative value of alternative explanations.

#### **Student Learning Outcome 3**

Characterize U.S. civil-military relations by emphasizing the roles, responsibilities, and culture of the military profession.

- a) Describe the roles and responsibilities of the military, both as a profession and as a bureaucratic entity, as established in the U.S. Constitution and through norms developed over time.
- b) Discuss the major theories of modern U.S. civil-military relations.
- c) Understand the challenges officers face in civil-military relations at the strategic (agenda-setting), operational (formulation and legitimization), and tactical (implementation) levels.

#### **Student Learning Outcome 4**

Describe the U.S. policy-making process.

- a) Compare the strengths and limitations of the different theoretical frameworks - normative and empirical, qualitative and quantitative - in evaluating the domestic policy-making process.
- b) Describe the influences of formal and informal actors on the development and implementation of U.S. foreign and domestic policy.
- c) Explain the theoretical foundations, American principles, and values that influence U.S. foreign and domestic policy.

### **Applied Statistics and Data Science (ASD0 )**

**[DA CD: DHA - STATISTICS / CIP CD: 27.0599 - Statistics, Other]**

Applied statistics uses a variety of computational techniques and methods in order to visualize and explore data, seek

and establish the structure and trends in data, investigate relationships between observed phenomena, and facilitate data interpretation. Data science expands on statistics to encompass the entire life cycle of data, from its specification, gathering, and cleaning through its management and analysis, to its use in making decisions and setting policy. The Data Science and Applied Statistics program at USMA provides Cadets the opportunity to effectively explore structured and unstructured data, define answerable questions, perform statistical analysis, and communicate results both written and orally. The program provides an introduction to the underlying mathematics of Data Science and Applied Statistics while simultaneously offering an exposure to computation and optimization issues inherent in large and disparate data sets.

Graduates who complete an Applied Statistics and Data Science major will be able to:

#### **Student Learning Outcome 1**

Develop and conduct experiments or test hypotheses, analyze and interpret data, and use scientific judgment to draw conclusions.

- Comprehend the basic statistical concepts of data analysis, data collection, modeling and inference.
- Be adept at data visualization using visualization techniques to communicate with others and identify weaknesses in proposed models.
- Employ statistical inference and draw conclusions using formal modeling.

#### **Student Learning Outcome 2**

Identify, formulate, and solve broadly defined technical or scientific problems by applying knowledge of mathematics and science and/or technical topics to areas relevant to Data Science and Applied Statistics.

- Comprehend the underlying structure of common models used in statistical and machine learning as well as the issues of optimization and convergence of algorithms.
- Formulate problems, plan data collection campaigns, and analyze the data to provide insights.
- Demonstrate proficiency in foundational software skills and the associated algorithmic, computational problem-solving strategies.

#### **Student Learning Outcome 3**

Formulate or design a system, process, procedure, or program to meet desired needs.

- Define clear requirements to a problem and use efficient strategies to arrive at an algorithmic solution using a suitable high-level computer language.
- Leverage existing packages and tools to solve computational problems.
- Work with a variety of sources and formats of data.
- Prepare the data for use with a variety of statistical methods and models.
- Ensure the integrity of the data throughout the entire analytical process.

#### **Student Learning Outcome 4**

Communicate effectively with a range of audiences.

- Communicate results both written and orally.

#### **Student Learning Outcome 5**

Understand ethical and professional responsibilities and the impact of technical and/or scientific solutions in global, economic, environmental, and societal contexts.

- Demonstrate understanding of ethical issues in Data Science Research including issues of reproducibility

#### **Student Learning Outcome 6**

Function effectively on teams that establish goals, plan tasks, meet deadlines, and analyze risk and uncertainty.

### **Behavioral Sciences: Applied Psychology (BEA0 )**

**[DA CD: BHS - BEHAVIORAL SCIENCE / CIP CD: 42.2813 - Applied Psychology]**

The Behavioral Sciences Program at West Point is an interdisciplinary, outcome-focused program designed to enhance cadets' ability to analyze and influence human behavior. Through rigorous coursework, cadets develop a comprehensive understanding of behavioral dynamics essential for effective leaders of character. Cadets have the opportunity to specialize by selecting one of three major tracks: Applied Psychology, Organizational Psychology and Leadership, or Military and Society. Each path offers a blend of theoretical knowledge and practical skills, supported by both qualitative and quantitative research training. The program culminates in an applied problem-solving capstone project, where cadets collaborate with real clients to tackle authentic leadership and organizational challenges. This hands-on experience ensures that graduates are not only theoretically informed but also practically adept at addressing complex issues. Aligned with West Point's mission, the Behavioral Sciences Program is committed to producing adaptable, ethically grounded leaders who are prepared to thrive in diverse and challenging environments.

The Behavioral Sciences Program provides cadets with a choice of three major tracks:

- The Applied Psychology major track is focused on applying knowledge of psychology to improve the development,

performance, and well-being of individuals (soldiers).

- The Organizational Psychology and Leadership major track is focused on applying knowledge of psychology to select and develop leaders, and improve the effectiveness of groups, teams, and organizations.
- The Military and Society major track is focused on applying knowledge of military and society to understand how institutions shape civil-military relations, influence military life, leader behaviors, and soldier experiences.

#### Behavioral Sciences Program Student Learning Outcomes and Supporting Objectives:

##### Student Learning Outcome 1

SLO1: Knowledge Application. Graduates will describe, compare, and apply key concepts, theories, and empirical findings in behavioral science to explain human behavior and address behavioral problems in real-world settings.

- SLO1a: Accurately describe and compare major concepts, theories, and research findings in behavioral science.
- SLO1b: Apply behavioral science knowledge to analyze and propose solutions to real-world problems.

##### Student Learning Outcome 2

SLO2: Research and Reasoning. Graduates will locate, evaluate, and use scholarly sources to design, conduct, and interpret basic behavioral research, while following ethical guidelines and demonstrating sound scientific reasoning.

- SLO2a: Design and interpret basic behavioral research using appropriate methods and ethical standards.
- SLO2b: Find and evaluate scholarly sources to support behavioral science arguments and research questions.

##### Student Learning Outcome 3

SLO3: Critical Thinking. Graduates will analyze behavioral problems from multiple perspectives and evaluate potential solutions by clearly connecting them to relevant theories and evidence.

- SLO3a: Analyze complex behavioral problems from multiple theoretical or contextual perspectives.
- SLO3b: Evaluate and justify solutions using relevant behavioral science theories and research.

##### Student Learning Outcome 4

SLO4: Communication. Graduates will communicate behavioral science concepts and findings clearly and professionally in both written and oral formats, adapting their message for different audiences and appropriately using AI tools and technologies to support their communication.

- SLO4a: Deliver clear, professional oral and written communication tailored to audience and purpose.
- SLO4b: Use AI tools and emerging technologies appropriately to enhance communication of behavioral science content.

##### Student Learning Outcome 5

SLO5: Professional Development and Leadership. Graduates will demonstrate how behavioral science knowledge contributes to effective leadership, teamwork, and community engagement, and will identify ways to continue learning and applying psychology in professional settings.

- SLO5a: Explain how behavioral science principles support leadership and team effectiveness.
- SLO5b: Demonstrate commitment to ongoing learning and professional development in behavioral science.

## Biology (BIO0 )

**[DA CD: GPC - MEDICAL SCIENCES GENERAL / CIP CD: 26.0101 - Biology/Biological Sciences, General]**

The Biology Major focuses on the evolution, structure, and processes of living organisms. Advances in molecular biology and biotechnology are providing significant improvements in the quality of our lives even as they alter the fundamental way we view life itself. Evolution, genetic engineering, recombinant DNA research, medical treatment, ecology, and emerging diseases are just a few of today's research areas under the life sciences heading. The Biology Major includes courses that give cadets an in-depth understanding of biology which when combined with math, chemistry and physics can be applied to Army needs. The major focuses on broader understanding of biology and biotechnology. In addition to the core course requirements and three-course engineering sequence (any of the sequences offered) cadets will complete an integrative experience (CH479 Methods and Applications of Biotechnology). This course examines the social, economic, political, ethical, and technological aspects of biotechnology. The Biology Major includes all the courses needed for cadets pursuing the Medical School Option as well as other post-graduate choices.

Applications of the life sciences involve all facets of our lives and are very important to our careers as military officers. A better understanding of biotechnology will allow us to use biosensors to detect weapons of bioterrorism. Biomolecular engineering will make possible the use of cells to manufacture novel biomaterials with specific properties

and functions. Biotechnology and biomedical engineering will improve the medical treatment of battlefield casualties. The most important "system" in the future Army will continue to be the human soldier. Because the soldier is a biological system, biotechnology offers unique potential for enhancing the performance of this most complex, critical, and costly of the Army's systems.

Graduates who complete a Biology Major will be able to:

**Student Learning Outcome 1**

Understand and apply the Scientific Method.

**Student Learning Outcome 2**

Gather, analyze, organize, and present scientific information.

**Student Learning Outcome 3**

Understand the basic principles of life science and chemistry, and their applications to the Army and Society.

**Student Learning Outcome 4**

Understand and apply basic instrumental methods of biological and chemical analysis.

**Student Learning Outcome 5**

Recognize the structure and understand the functions of biomolecules.

**Student Learning Outcome 6**

Know the structures and functions of eukaryotic and prokaryotic cells.

**Student Learning Outcome 7**

Understand the principles of bioenergetics and metabolism.

**Student Learning Outcome 8**

Understand the structure-function relationships at all levels of organization of living organisms.

**Student Learning Outcome 9**

Understand evolutionary biology and its importance.

**Student Learning Outcome 10**

Understand ecology (organization, diversity, and interdependence of living organisms).

---

## **Chemical Engineering (CEN2 )**

**[DA CD: CEX - ENGINEERING,CHEMICAL / CIP CD: 14.0701 - Chemical Engineering]**

Chemical engineering is perhaps the broadest and most diverse field in all of engineering. Any commercial process or product that uses or contains molecules probably involved a chemical engineer at some stage of development. This includes all materials used by the military, including such basic items as food, clothing, fuel, water, explosives, metals, polymers, ceramics, semiconductors, medicines, artificial organs, and prostheses, just to name a few. Chemical engineers design these materials at the molecular level, optimize the design for specific applications, and develop efficient methods for production, packaging, and distribution. Chemical engineers are also very concerned with the conversion between matter and energy, particularly since almost all chemical reactions require or produce energy. In terms of contemporary social problems, chemical engineers are at the forefront of efforts to develop new and more efficient energy sources, and we are critical to efforts at environmental remediation, including waste recycling and remediation. Within the military, chemical engineers are uniquely qualified to address problems in fuel and water production and distribution, power generation, as well as detection, decontamination, and protection against chemical and biological agents.

The chemical engineering program is accredited by the Engineering Accreditation Commission of ABET, <https://www.abet.org>, under the commission's General Criteria and Program Criteria for Chemical, Biochemical, Biomolecular, and Similarly Named Engineering Programs.

The mission of the chemical engineering program is to prepare commissioned leaders of character who possess the intellectual capital to leverage new and emerging technologies.

Program Educational Objectives: During a career as commissioned officers in the United States Army and beyond, program graduates:

- (1) Demonstrate effective leadership by leveraging chemical engineering expertise and precise technical communication.
- (2) Contribute to the solution of complex problems in a dynamic environment.
- (3) Apply disciplined technical expertise to succeed in advanced study programs.

On completion of the chemical engineering program, our graduates demonstrate:

**Student Learning Outcome 1**

an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics.

**Student Learning Outcome 2**

an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors.

**Student Learning Outcome 3**

an ability to communicate effectively with a range of audiences.

**Student Learning Outcome 4**

an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts.

**Student Learning Outcome 5**

an ability to function effectively on a team whose members together provide leadership, create a collaborative environment, establish goals, plan tasks, and meet objectives.

**Student Learning Outcome 6**

an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions.

**Student Learning Outcome 7**

an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

**Student Learning Outcome 8**

Understand the chemical engineering curriculum, including chemistry, material and energy balances, safety and environmental factors, thermodynamics of physical and chemical equilibria, heat, mass, and momentum transfer, chemical reaction engineering, continuous and staged separation processes, process dynamics and control, modern experimental and computing techniques, and process design.

---

**Chemistry (CHM2 )**

**[DA CD: DDB - CHEMISTRY,ANALYTICAL,GENERAL / CIP CD: 40.0501 - Chemistry, General]**

Chemistry is the branch of sciences that studies the composition, structure, properties, changes and interactions of matter. Every material thing - from the foods we eat, to the medicine we take, to the air we breathe - is a chemical or a mixture of chemicals. Therefore, it is truly the central science and underpins much of the efforts of scientists and engineers to improve life for humankind. Since chemistry is the molecular science, military applications of chemistry rely on the understanding of the structure and changes at the molecular level. These application areas can include the synthesis and development of advanced materials and explosives, solving environmental problems, creating innovative biotechnology solutions, and chemical or biological sensing.

The Chemistry Major includes all the courses recommended by the American Chemical Society and are designed to provide cadets with basic instruction with comparable emphasis on the areas of analytical chemistry, biochemistry, inorganic chemistry, organic chemistry and physical chemistry. Cadets are required to complete a core sequence. In addition, cadets must complete a three-course engineering sequence and may choose from any of the sequences offered. Ten courses are required to complete the major. Thus, the Chemistry Major requires a total of 40 courses to be taken or validated. Cadets choosing this program will complete an integrative experience (CH487 Advanced Chemistry Laboratory) that will examine the social, economic, political, and technological aspects of chemistry. The Chemistry Major with ACS Certification includes one elective course and two research courses (CH489 and CH490). The Chemistry Major with ACS Certification and Honors requires cadets to complete the course requirements for the CHM1A major while attaining a minimum APSC of 3.0 in the core curriculum and 3.5 in the major.

Graduates who complete a Chemistry Major will be able to:

**Student Learning Outcome 1**

- Use information resources to gather, organize, and understand scientific material.

**Student Learning Outcome 2**

- Design and execute experiments to address a problem or question.

**Student Learning Outcome 3**

- Analyze and assess scientific data gathered in the laboratory.

**Student Learning Outcome 4**

- Effectively and clearly communicate scientific information in written and oral form to a variety of audiences.

**Student Learning Outcome 5**

- Understand the applications of chemistry in the Army and society.

**Student Learning Outcome 6**

- Recognize the relationship between the properties of a substance, its molecular structure, and its reactivity.

**Student Learning Outcome 7**

- Understand and apply the physical concepts of chemistry.

**Civil Engineering (CVN3 )**

**[DA CD: CCX - CIVIL ENGINEERING / CIP CD: 14.0801 - Civil Engineering, General]**

Civil Engineers design, build, and maintain the infrastructure of modern civilization. Civil Engineers are unique problem solvers, who apply their technical know-how to meet the challenges of disaster relief, deteriorating facilities, traffic congestion, floods, earthquakes, environmental contamination, and community planning. The Civil Engineering program is accredited by the Engineering Accreditation Commission of ABET, <http://www.abet.org>. Civil Engineering majors apply the knowledge of mathematics and science; analyze and solve problems in structural, geotechnical, hydraulic/hydrology, construction engineering; conduct experiments in Civil Engineering technical areas, and analyze and interpret the resulting data; design a Civil Engineering project; use probability and statistics to address uncertainty; include principles of sustainability in design; explain basic concepts in project management, business, public policy, and leadership; analyze issues in professional ethics; and explain the importance of professional licensure. Civil Engineering majors engage in a year-long capstone project requiring them to identify, formulate, and solve open-ended and complex engineering problem in teams. The teams use an iterative design process to define the problem and requirements, analyze alternatives within constraints (e.g., applicable codes and standards), and select the best alternative to solve the problem. The design process takes into consideration public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors. Teams communicate their process and solution through written deliverables and presentations to a range of audiences. In the Army, Civil Engineers provide leadership and technical abilities to support combat operations and manage the infrastructure at Army installations worldwide. As part of the United States Army Corps of Engineers, Civil Engineers provide vital public engineering to support our Nation's security, energize the economy, and reduce risks from disasters. Cadets who maintain good standing in the Civil Engineering major take the Fundamentals of Engineering (FE) exam during the spring semester of their First-Class year. Passing the FE exam is the essential first step in becoming a registered professional Civil Engineer.

Graduates who major in Civil Engineering will achieve the following Civil Engineering Program Educational Objectives within a few years after graduation. Civil Engineering majors are expected to attain:

1. MULTIPLE POSITIONS OF RESPONSIBILITY as Army leaders in which they (a) drive outcomes, (b) inform, influence, and inspire others, and (c) build teams.
2. PERSONAL AND PROFESSIONAL GROWTH through formal and informal learning opportunities while serving as professional role models to others.
3. EXPERIENCE IN PROVIDING ENGINEERING EXPERTISE to the Army and Nation to design solutions, solve complex and technical problems, and innovate for winning in a complex environment.

To achieve these objectives, cadets will demonstrate the following Civil Engineering Student Outcomes:  
At the time of graduation, Civil Engineering majors will have attained:

**Student Learning Outcome 1**

an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics.

---

**Student Learning Outcome 2**

an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors.

**Student Learning Outcome 3**

an ability to communicate effectively with a range of audiences.

**Student Learning Outcome 4**

an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts.

**Student Learning Outcome 5**

an ability to function effectively on a team whose members together provide leadership, create a collaborative environment, establish goals, plan tasks, and meet objectives.

**Student Learning Outcome 6**

an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions.

**Student Learning Outcome 7**

an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

---

**Computer Science (CSC1 )**

**[DA CD: CUE - COMPUTER SCIENCE / CIP CD: 11.0101 - Computer and Information Sciences, General]**

Computer scientists analyze, plan, design, and build computer systems. Within this broad area of computer system design, the computer science program at USMA provides cadets the opportunity to focus on the design of computer software components and the implementation of software systems. The program provides a solid introduction to the general field of computer science, including computer theory, computer programming, algorithm analysis, data structures, software testing and development, computer organization, programming languages, operating systems, and the design of large software systems. According to your interests, you may pursue further study in artificial intelligence, computer graphics, computer networks, cyber security, and other topics. The opportunity to accomplish advanced individual study under the direction of a faculty member is available to those who are interested and qualified. Whether operating a remote sensor network from a fire base in Afghanistan, managing logistics from a Brigade Support Area in Kuwait, pattern matching events for intelligence purposes in Iraq, or simply understanding the computational feasibility of solving a complex problem, the Computer Science major prepares you to succeed as a leader in any branch of the Army and is a superb foundation for advanced civil schooling. The USMA Computer Science major is accredited by the Computing Accreditation Commission of ABET, <http://www.abet.org>.

The Program Educational Objectives (PEO) for Computer Science are that, five to seven years after graduation, graduates who majored in Computer Science will have been successful Army officers who:

- A. Initiated and completed tasks that identify aspects of a complex situation that can be enhanced by using computing technology.
- B. Applied computing knowledge and skills while using an engineering process individually or in diverse teams to develop computing technology applications.
- C. Used effective communication to explain new computing technology to war fighters in support of current and emerging Army war fighting doctrine.
- D. Grown professionally through self-study, continuing education and professional development.

To support these objectives, at the time of graduation, Computer Science graduates will have an ability to:

**Student Learning Outcome 1**

Analyze a complex computing problem and apply principles of computing and other relevant disciplines to identify solutions.

**Student Learning Outcome 2**

Design, implement, and evaluate a computing-based solution to meet a given set of computing requirements in the context of the computer science discipline.

**Student Learning Outcome 3**

Communicate effectively in a variety of professional contexts.

**Student Learning Outcome 4**

---

Recognize professional responsibilities and make informed judgments in computing practice based on legal and ethical principles.

**Student Learning Outcome 5**

Function effectively as a member or leader of a team engaged in activities appropriate to the computer science discipline.

**Student Learning Outcome 6**

Apply computer science theory and software development fundamentals to produce computing-based solutions.

---

**Cyber Science (CYS1 )**

**[DA CD: BNA - CYBER OPERATIONS / CIP CD: 11.1003 - Computer and Information System Security/Information Assurance]**

The Cyber Science Major is the study of the structure, behavior, and effective use of cyberspace in the presence of intelligent, adaptive, and evolving adversaries, both human and artificial. Cyberspace is made up of hardware, software, information, people, organizations, policies, and laws. Building on a common 12-course foundation, this flexible major allows cadets to choose a cyber in society elective, a cyber operations elective, and 4 cyber electives. The flexibility built into this major gives cadets the ability to craft the cyber experience that best aligns with their interests, whether that be cyber policy, infrastructure defense, cyber operations, or a hybrid. Cadets who successfully complete the NSA prescribed Cyber Operations program of study will earn Cyber Science with Cyber Operations distinction.

Graduates who complete the Cyber Science major will be able to:

**Student Learning Outcome 1**

Analyze a complex computing problem and apply principles of computing and other relevant disciplines to identify solutions.

**Student Learning Outcome 2**

Design, implement, and evaluate a computing-based solution to meet a given set of computing requirements in the context of Cyber Science.

**Student Learning Outcome 3**

Communicate effectively in a variety of professional contexts.

**Student Learning Outcome 4**

Recognize professional responsibilities and make informed judgments in computing practice based on legal and ethical principles.

**Student Learning Outcome 5**

Function effectively as a member or leader of a team engaged in activities appropriate to Cyber Science.

**Student Learning Outcome 6**

Apply security principles and practices to maintain operations in the presence of risks and threats.

---

**Cyber Science: Cyber Operations (CYE0 )**

**[DA CD: BNA - CYBER OPERATIONS / CIP CD: 11.1003 - Computer and Information System Security/Information Assurance]**

The Cyber Science Major is the study of the structure, behavior, and effective use of cyberspace in the presence of intelligent, adaptive, and evolving adversaries, both human and artificial. Cyberspace is made up of hardware, software, information, people, organizations, policies, and laws. Building on a common 10-course foundation, this flexible major allows cadets to choose one of five depth concentrations: Cybersecurity, Network Services, Cyber Operations, Cyber-Physical Systems, and Artificial Intelligence.

This description and outcomes apply to all tracks of the Cyber Science Major, not just Cyber Science: Cyber Operations.

Graduates who complete the Cyber Science major will be able to:

**Student Learning Outcome 1**

- Analyze a complex computing problem and apply principles of computing and other relevant disciplines to identify solutions.

**Student Learning Outcome 2**

- Design, implement, and evaluate a computing-based solution to meet a given set of computing requirements in the context of Cyber Science.

**Student Learning Outcome 3**

- Communicate effectively in a variety of professional contexts.

**Student Learning Outcome 4**

- Recognize professional responsibilities and make informed judgments in computing practice based on legal and ethical principles.

**Student Learning Outcome 5**

- Function effectively as a member or leader of a team engaged in activities appropriate to Cyber Science.

**Student Learning Outcome 6**

- Apply security principles and practices to maintain operations in the presence of risks and threats.

**Defense and Strategic Studies (DSS2 )**

**[DA CD: BMT - DEFENSE AND STRATEGIC STUDIES / CIP CD: 29.0399 - Military Applied Science, Other]**

The Defense & Strategic Studies (DSS) academic major will continue to reach the Academy's overarching goal through a multidisciplinary approach in its program structure and an interdisciplinary approach within its courses. The program will continue to draw upon military science, history, economics, political science, geography, leadership, information technology and law to understand the nature of war and the military instrument of national power.

**DSS Major Student Learning Outcomes and Supporting Objectives****Student Learning Outcome 1**

Evaluate military strategic decision-making by applying appropriate theoretical, historical, policy and interdisciplinary knowledge.

- a. Cadets can develop a diverse and appropriate base of knowledge to effectively evaluate strategic choices, to include formal strategies and military systems, using a holistic approach.
- b. Cadets can explain the relationship between tactics, operations and strategy with an emphasis on the strategic effect of tactical action.

**Student Learning Outcome 2**

Cadets can frame complex, multifaceted strategic problems relating to the military component of national power and the potential use of force.

- a. Cadets can deconstruct the problem into its essential components and describe how they interrelate by effectively examining the political and military context.
- b. Cadets can identify relevant stakeholders, interests and policy objectives for state and non-state actors.
- c. Cadets can explain the influence that state and non-state actors' organizations, capabilities and systems have on the problem definition.

**Student Learning Outcome 3**

Cadets can apply theoretical frameworks, strategic planning models and critical thinking to construct viable and innovative ways to solve strategic problems.

- a. Cadets can identify and apply relevant theories and models to forming viable and innovative solutions.
- b. Cadets can translate well researched, reliable evidence into useful conclusions.

**Student Learning Outcome 4**

Cadets can Communicate and connect with a diverse range of audiences in order to frame and deliver an insightful strategic analyses.

- a. Cadets can formulate a clear, direct message that communicates the fundamental conclusion(s) up front.
- b. Cadets can persuasively communicate the necessary evidence and reasoning by logically organizing the information or argument.
- c. Cadets can effectively communicate through oral presentation by keeping the audience engaged with creativity, poise and competence.
- d. Cadets can effectively communicate through writing by being precise, concise and clear.

**Economics (ECN2 )**

**[DA CD: EDX - ECONOMICS,GENERAL / CIP CD: 45.0603 - Econometrics and Quantitative Economics]**

The Economics major provides critical thinking skills applied to human behavior and answers the questions: "What is

produced?; How is it produced?; and To whom is it allocated?" Mathematical models are used to develop and test optimal resource allocation mechanisms. These models also provide the necessary foundation to analyze policy regimes within individual markets as well as aggregate economies. These skills are directly applicable to decision makers in tactical command positions who must achieve desirable outcomes with personnel and equipment constraints as well as national strategic decision makers who face similar aggregate constraints. The Economics major also provides deep proficiency in quantitative methods, particularly nonlinear optimization, for more specialized areas such as Operations Research, Resource Management, and Strategist.

## Economics Major Student Learning Outcomes

### Student Learning Outcome 1

Constrained Optimization: Cadets can derive the objective functions and resource constraints facing individuals, firms, and governments, and then solve the relevant optimization problems to describe and predict the behavior of economic agents.

### Student Learning Outcome 2

Market Analysis: Using the outcomes derived from optimization, Cadets can explain how markets and the aggregate economy achieve equilibrium, and then predict how changes in the economic environment impact individual markets and the aggregate economy.

### Student Learning Outcome 3

Market Efficiency: Cadets can apply economic models of individual, firm, and government behavior to evaluate whether equilibrium in a market achieves economic efficiency (the maximization of total surplus).

### Student Learning Outcome 4

Marginal Analysis: Cadets can apply the concept of equalization at the margin to explain and evaluate individual, firm, and government behavior, as well as perform cost-benefit analyses of government policies.

### Student Learning Outcome 5

Incentives: Cadets can explain the central role of incentives in shaping the behavior of economic agents and design incentive structures that promote efficient outcomes.

### Student Learning Outcome 6

Strategic Decision Making: Cadets can model and evaluate economic environments in which the actions of economic agents are interdependent.

### Student Learning Outcome 7

Risk and Uncertainty: Cadets can model and evaluate the impact of uncertain economic outcomes due to either random shocks or the strategic behavior of economic agents, and explain how differential aversion to risk across individuals, firms, and governments affects market outcomes.

### Student Learning Outcome 8

Information: Cadets can model and evaluate the effects of costly, limited, and asymmetric information on economic decision making, and derive policies to mitigate the efficiency losses arising from imperfect and incomplete information.

### Student Learning Outcome 9

Global Economic Linkages: Cadets can model economic interactions of individual consumers, investors, firms and governments in international goods, capital, and currency markets, and evaluate the efficiency costs of government policies that restrain economic exchange among nations.

### Student Learning Outcome 10

Political Economy: Cadets can apply economic models to understand behaviors of agents in political and other "non-economic" settings, and use models drawn from allied social science fields (Political Science, Psychology, Sociology, and Geography) to derive richer explanations of the behavior of individuals, firms and organizations (including governments).

### Student Learning Outcome 11

Government Intervention in Markets: Cadets can use economic models to evaluate the impact(s) of government regulations and policies on market outcomes, as well as design interventions that improve economic efficiency or minimize efficiency losses.

### Student Learning Outcome 12

Macroeconomic Stabilization: Cadets can use economic models to explain and predict fluctuations in key macroeconomic variables, and design fiscal and monetary policies to dampen these fluctuations.

### Student Learning Outcome 13

Economic Growth: Cadets can build models that explain and predict the determinants of economic growth in the long-run, evaluate the impact(s) of government policies on growth, and design policies to promote economic growth.

### Student Learning Outcome 14

---

Empirical Methods: Cadets can: apply economic theory to identify testable hypotheses; collect the requisite data and use appropriate empirical methods to test hypotheses; develop empirical models that can identify the causal effect of an economic variable of interest on an outcome of interest; and interpret the findings from statistical and empirical analyses as well as explain their relevance to policy making.

---

## **Electrical Engineering (EEN1 )**

**[DA CD: CHX - ENGINEERING,ELECTRICAL / CIP CD: 14.1001 - Electrical, Electronics, and Communications Engineering]**

The impact of the electronics revolution on our daily lives may exceed that of the industrial revolution. The advent of the integrated circuit and the microprocessor have made possible phenomenal advances in such varied fields as medicine, communications, manufacturing, computation, education, energy conversion, and weapons systems. Electrical engineers are at the forefront of this revolution, using the principles of physics, mathematics and the engineering sciences to develop new and innovative applications of electronics. Regardless of branch, officers will surely be involved with electronic systems in military hardware. The courses in the electrical engineering curriculum are directly applicable to the Army you will lead. As a student of electrical engineering you will develop a mastery of the fundamental elements of circuit theory, electromagnetic fields and waves, electronics, digital computer logic and electromechanical energy conversion. You will then study in greater depth subjects selected from the areas of robotics, communications, opto-electronics, alternative energy and cyber engineering. The program emphasizes practical design, hands-on laboratory and computer experience, teamwork, and interdisciplinary projects. The program additionally provides a sound basis for graduate schooling in electrical engineering and related fields as well as fulfilling the disciplinary depth component of the USMA curriculum. The Electrical Engineering Program is accredited by the Engineering Accreditation Commission of ABET, <http://www.abet.org>.

The Electrical Engineering Program objectives are that five to seven years after graduation cadets who major in Electrical Engineering will have been successful Army officers who have:

- Applied their engineering, management, and leadership skills in service of their country.
- Demonstrated intellectual growth through self-study, continuing education, and professional development in the Army.
- Provided technical leadership and disciplinary knowledge as Army officers with a broad understanding of the potential ethical and societal impacts of technology.
- Applied engineering methodology and creativity to Army problems while effectively communicating across mediums and cultures.

Expected Student Outcomes for graduating cadets in the Electrical Engineering major are:

### **Student Learning Outcome 1**

an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics.

### **Student Learning Outcome 2**

an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors.

### **Student Learning Outcome 3**

an ability to communicate effectively with a range of audiences.

### **Student Learning Outcome 4**

an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts.

### **Student Learning Outcome 5**

an ability to function effectively on a team whose members together provide leadership, create a collaborative environment, establish goals, plan tasks, and meet objectives.

### **Student Learning Outcome 6**

an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions.

### **Student Learning Outcome 7**

an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

---

## **Engineering Management (ENM1 )**

---

**[DA CD: CYX - ENGINEERING, INDUSTRIAL / CIP CD: 15.1501 - Engineering/Industrial Management]**

Engineering Management majors study the engineering relationships among the management tasks of staffing, organizing, planning, financing, and the human element in production, research, engineering, and service organizations. By emphasizing leadership in a technical setting, the program builds on the traditional roles of the basic and applied sciences for engineering and technology management. Engineering managers must understand the interaction of organizational, technical, and behavioral variables in order to build a productive engineering team. Majors get a technical foundation in a specific engineering field of their choice: civil, electrical, nuclear, infrastructure, environmental, software, chemical, or general engineering. The program also provides a solid base of courses in engineering economy, production operations management, supply chain engineering, quantitative business analysis, project management, and computer modeling in order to prepare graduates to lead in a technical environment. The program culminates with a capstone design experience for a real client. The Engineering Management program at West Point is one of the top undergraduate programs in the nation and provides the academic foundations for a wide variety of activities important to Army officers of all branches. The Engineering Management Program is accredited by the Engineering Accreditation Commission of ABET, <http://www.abet.org>.

**Engineering Management Program Educational Objectives:** The Engineering Management Program seeks to prepare future Army officers for productive and rewarding careers in engineering or related professions for service to the nation. Five to seven years after graduation, cadets who majored in Engineering Management will have been successful Army officers who:

1. Successfully lead and participate as a member of multi-disciplinary teams in a diverse cultural environment.
2. Apply critical thinking to their engineering, management, and leadership skills to design solutions to complex problems.
3. Demonstrate intellectual growth and continuous self-improvement through self-study, continuing education, and professional development.
4. Demonstrate effective communicating skills across a variety of mediums and cultures.
5. Act responsibly by upholding strict ethical and moral standards and considering impacts of decisions on social, political, economic, and technological issues.

To achieve these objectives, cadets will demonstrate the following Engineering Management Student Outcomes at the time of graduation:

**Student Learning Outcome 1**

an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics.

**Student Learning Outcome 2**

an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors.

**Student Learning Outcome 3**

an ability to communicate effectively with a range of audiences.

**Student Learning Outcome 4**

an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts.

**Student Learning Outcome 5**

an ability to function effectively on a team whose members together provide leadership, create a collaborative environment, establish goals, plan tasks, and meet objectives.

**Student Learning Outcome 6**

an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions.

**Student Learning Outcome 7**

an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

---

**Engineering Psychology (EPS1 )****[DA CD: CYA - HUMAN FACTORS ENGINEERING / CIP CD: 30.2501 - Cognitive Science]**

Engineering Psychology is one of four majors available through the Department of Behavioral Sciences and Leadership. It bridges the disciplines of experimental psychology and engineering by providing cadets with a strong foundational knowledge of the psychology of human performance and how these principles of behavior can be used to engineer and evaluate more effective systems. In the Yearling and Cow years, Engineering Psychology majors enroll in courses designed to teach research and statistical skills, and a series of courses that teach them about the scientific foundation of human behavior. In their Firstie year, they learn to apply this knowledge in the design and evaluation of complex systems.

## Engineering Psychology Major Student Learning Outcomes and Supporting Objectives

### Student Learning Outcome 1

Apply knowledge of human performance to operational readiness and total system design.

- Objective 1: Relate principles of the human nervous and endocrine systems to human performance
- Objective 2: Analyze the characteristics of human perceptual processes in the design of complex systems and work environments
- Objective 3: Apply understanding of human cognitive structure to system design
- Objective 4: Illustrate the limitations of the human body and biomechanics on human performance

### Student Learning Outcome 2

Design, conduct, and analyze research in human performance in person/system interaction.

- Objective 1: Apply descriptive and inferential statistics in analyzing data in research projects
- Objective 2: Synthesize scientific literature in deriving an experimental hypothesis
- Objective 3: Design appropriate research methods to answer a scientific question

### Student Learning Outcome 3

Evaluate research in human performance and person/system interaction.

- Objective 1: Analyze the validity of research methods used in published studies
- Objective 2: Contrast different empirical approaches to a given human performance research question
- Objective 3: Synthesize different research findings into an structured new whole
- Objective 4: Analyze an existing system and design an alternative and more functional system

### Student Learning Outcome 4

Report and defend scientific findings in oral and written format.

- Objective 1: Describe scientific data and theories orally and in writing
- Objective 2: Apply the American Psychological Association's style in preparing written research reports
- Objective 3: Infer extrapolations from research findings to related phenomenon

## English (ENL2 )

**[DA CD: ADX - ENGLISH / CIP CD: 23.0101 - English Language and Literature, General.]**

Cadets who major in English refine skills of analysis and creativity and enrich their imaginative capacities by studying the literary and artistic expressions of primarily Anglo-American and, to a lesser extent, global cultures. Exposed to a range of literary genres and modes of cultural expression, English majors graduate with a broader and deeper understanding of the history of ideas and of the ways in which imaginative literature has influenced human behavior and shaped cultural norms. By exploring the full spectrum of human behaviors and circumstances and by laying the groundwork for the cultivation of emotional intelligence and sympathetic imagination, the study of literature equips graduates to engage the world's intellectual, moral, and emotional complexities with insight and the potential for empathy. English majors refine their listening, speaking, reading, and writing skills in a variety of analytic and creative situations from the textual analysis of poetry and prose to the study of literary history to dramatic performance. The English major with Honors further challenges Cadets to compose a lengthy academic research project in close consultation with a member of the doctoral faculty. With an English major, a Cadet graduates from West Point with the capacity to analyze textual evidence, to account for cultural context and complexity, to communicate precisely, and to imagine creative solutions to difficult problems--attributes that, taken together, constitute excellent preparation for Army service in the twenty-first century and for life more broadly.

### Student Learning Outcome 1

English majors will possess a body of knowledge specific to the study of literature.

Cadets will

- (1) Understand important conventions of literary scholarship, including critical vocabulary, terminology, and research methods.
- (2) Receive a strong foundation in Anglo-American literary history.
- (3) Be exposed to significant works of world literature and to global perspectives.

## Student Learning Outcome 2

English majors will communicate effectively within the discipline, observing audience, vocabulary, conventions, and methodology. Cadets will

- (1) Learn to recognize the difference between rational and emotional responses to texts.
- (2) Speak about literature and culture with depth, nuance, clarity, and precision.
- (3) Practice standard skills of literary scholarship, including close reading, analysis in context, and the application of various critical and theoretical lenses.
- (4) Write effective academic and creative texts that display an appropriate understanding of subject, audience, and purpose.
- (5) Write an extended literary research paper that incorporates secondary sources.

## Student Learning Outcome 3

Student Learning Outcome 3

English majors will apply knowledge of literature within and across disciplinary boundaries

Cadets will

- (1) Gain a knowledge of literature's historical, social, cultural, and political contexts.
- (2) Gain an understanding of the influence of literary models and archetypes on human behavior, especially on the behavior of military professionals; and an awareness of the role of literature within the cultures of other countries and regions.
- (3) Draw meaningful connections between literature and other disciplines in discussion and writing.

## Student Learning Outcome 4

Student Learning Outcome 4

English majors will demonstrate the capability and the desire to pursue continued intellectual development.

Cadets will

- (1) Value the continuing study of literature and other intellectual pursuits.
- (2) Be able to work independently and collaboratively in literary studies or other intellectual fields.

## Student Learning Outcome 5

Student Learning Outcome 5

English majors will cultivate particular habits of mind exercised through literary study.

Cadets will

- (1) Acknowledge and reckon with ambiguity.
- (2) Cultivate patience and the faculty of deep attention.
- (3) Take intellectual and imaginative risks in creative projects.
- (4) Learn to approach problems with resilience, resourcefulness, and invention.

## Environmental Engineering (EVE2 )

**[DA CD: CCO - ENVIRONMENTAL ENGINEERING / CIP CD: 14.1401 - Environmental/Environmental Health Engineering]**

The environmental engineering program is designed for cadets who want to tackle today's most pressing environmental challenges and create innovative, engineered solutions for a sustainable and resilient future. As global concerns such as emerging contaminants, urbanization, and resource scarcity accelerate, environmental engineers play a crucial role in designing sustainable solutions that protect public health and welfare, and prevent future environmental degradation. They apply core knowledge of chemical, biological, and physical processes to remediate environmental contaminants in the air, water, and soil; design water and wastewater treatment systems; manage hazardous and solid waste; improve air quality; assess environmental impacts of projects; and contribute to renewable energy development and circular economy strategies. This discipline is rapidly evolving through its integration with advances in technology and artificial intelligence.

The environmental engineering program emphasizes hands-on learning, critical thinking, and interdisciplinary teamwork via the complete integration of design and laboratory experiences throughout the curriculum. Graduates gain a strong foundation in math, science, and engineering fundamentals so that they are well equipped to understand and combat complex problems in a rapidly changing Army and environmental landscape. Graduates are well-prepared to excel as officers and engineers. The Environmental Engineering Program is accredited by the Engineering Accreditation Commission of ABET, <https://www.abet.org/>.

The Program Educational Objectives (PEOs) of the Environmental Engineering Program identify what our graduates can accomplish within a few years following graduation. PEOs are reviewed at least biennially by the Environmental Engineering Board of Advisors. PEOs were most recently revised in April 2025 and placed into effect beginning fall term 2025.

Within a few years following graduation, West Point environmental engineering graduates:

1. Are leaders of character able to:
  - a. develop innovative solutions to solve complex cross-disciplinary problems.

- b. minimize environmental impacts.
  - c. inspire teams to execute projects within constraints.
  - d. collaborate with partners and build consensus.
- 2. Possess professional skills enabling them to:
  - a. effectively communicate pertinent information, including environmental topics, to a range of audiences.
  - b. manage resources.
  - c. evaluate, mitigate, manage, and communicate risk.
- 3. Understand the importance of continued self-development to:
  - a. achieve professional licensure and certification.
  - b. pursue continuing education and technical skill development.
  - c. seek formal and informal enrichment experiences including community outreach and environmental stewardship.
  - d. seek mentorship and mentor others.
- 4. Internalize professional values that enable them to have:
  - a. continued inculcation of Army values and understanding of Army priorities.
  - b. the ability to analyze an engineering challenge involving conflicting ethical and professional interests and determine an appropriate course of action.

The Student Learning Outcomes of the Environmental Engineering Program identify what our graduates can accomplish upon graduation.

#### **Student Learning Outcome 1**

an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics.

#### **Student Learning Outcome 2**

an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors.

#### **Student Learning Outcome 3**

an ability to communicate effectively with a range of audiences.

#### **Student Learning Outcome 4**

an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts.

#### **Student Learning Outcome 5**

an ability to function effectively on a team whose members together provide leadership, create a collaborative environment, establish goals, plan tasks, and meet objectives.

#### **Student Learning Outcome 6**

an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions.

#### **Student Learning Outcome 7**

an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

### **Environmental Science (ESC2 )**

**[DA CD: CCQ - ENVIRONMENTAL SCIENCE / CIP CD: 03.0104 - Environmental Science]**

Environmental science is a broad, integrative, science-based discipline which focuses on the interrelationships between people and the environment. Environmental scientists conduct investigations to analyze these interrelationships and to identify, abate, or eliminate human-caused pressures on the environment. The ultimate goal of these investigations is to create a sustainable balance between humans and the natural world that minimizes environmental degradation. This major develops expertise into the processes that sustain our environment by expanding upon the West Point core science education by adding studies in the natural sciences such as biology, ecology, geology, and meteorology, and in the integrative studies of environmental decision making and environmental security. This broad academic background is excellent preparation for challenges faced by a military leader who must balance resource and human requirements. The program seeks to (1) enhance your curiosity about natural processes and your ability to study such processes as a scientist and (2) deepen your knowledge of human influences on the environment and foster evaluation of our individual and collective responsibilities as environmental stewards.

The Environmental Science Student Learning Outcomes are designed to:

**Student Learning Outcome 1**

Enhance curiosity about natural processes and one's ability to study such processes as a scientist.

**Student Learning Outcome 2**

Deepen knowledge of human influences on the environment and foster evaluation of our individual and collective responsibilities as environmental stewards.

**Student Learning Outcome 3**

Develop one's ability to evaluate the connections between the environment and individual, national, and global security.

**Student Learning Outcome 4**

Improve one's facility with the tools of environmental science by developing proficiency in collecting and analyzing lab and field data, deducing patterns, and formulating the next step in an on-going study.

**Student Learning Outcome 5**

Provide a solid foundation in earth, air, water and life sciences and their interconnections.

**Foreign Area Studies: Africa (FSI2 )**

**[DA CD: EBX - AREA STUDIES / CIP CD: 05.0101 - African Studies]**

This description and outcomes apply to all Foreign Area Studies Majors, not just Foreign Area Studies: Africa.

A Foreign Area Studies Major is offered to Cadets interested in pursuing an interdisciplinary study of Africa, East Asia, Eurasia, Europe, Latin America, or the Middle East. Cadets choosing one of these area programs will study the

peoples, societies, languages, cultures, geography, history, foreign relations, politics, and economics of a particular region. Cadets will have the opportunity to study in depth the factors that frequently determine national objectives and influence the formulation of governmental policy.

### **Student Learning Outcome 1**

Foreign Area Studies Majors will be proficient in their respective languages.

Cadets will be able to

- (1) Demonstrate foreign language proficiency in listening, speaking, reading, and writing.
- (2) Combine linguistic skills and critical thinking to perform research and conduct analysis.
- (3) Deliver research findings to diverse audiences.

### **Student Learning Outcome 2**

Foreign Area Studies Majors will develop the cultural competence needed to interact effectively with members of the target community.

Cadets will be able to

- (1) Describe and explain crucial figures and events in the history of the target region.
- (2) Discuss significant recent cultural developments.
- (3) Analyze contemporary issues, guided by knowledge of the region's history.
- (4) Account for limitations in existing conceptual frameworks as applied to cultural studies.

### **Student Learning Outcome 3**

Foreign Area Studies Majors will be knowledgeable of the regional dynamics of LX-speaking countries.

Cadets will be able to

- (1) Describe the target region's armed forces.
- (2) Analyze the impact of the physical and human geography on contemporary society.
- (3) Apply concepts of cross-cultural inquiry to evaluate regional change.
- (4) Identify and explain sources of intercultural conflicts.
- (5) Summarize US policies related to the LX-speaking region.

### **Student Learning Outcome 4**

Foreign Area Studies Majors will be critical thinkers.

Cadets will be able to

- (1) Integrate acquired knowledge in area studies and foreign languages with other humanities and social sciences disciplines.
- (2) Transfer language proficiency and intercultural capabilities to the study of and engagement with other language communities.
- (3) Navigate successfully the challenges of living in another culture.

## **Foreign Language: Arabic (FLA2 )**

**[DA CD: AAZ - ARABIC / CIP CD: 16.1101 - Arabic Language and Literature]**

This description and outcomes apply to all foreign language majors and dual language majors, not just Foreign Language: Arabic

The ability to understand and speak a foreign language is a window into the thinking and values of another people. Cadets majoring in foreign languages develop operational proficiency in the foreign language and attain an informed understanding of the culture and regional dynamics of the country or countries where the language is used. These capabilities are invaluable assets to future officers in a globally committed US Army. Majors may focus on the study of a single language: Arabic, Chinese, French, German, Persian, Portuguese, Russian or Spanish; or they may pursue the Dual Foreign Language Major by combining studies of any two of the eight languages. Advanced level study in all languages includes courses in literature, civilization, military readings, and media.

### **Student Learning Outcome 1**

Foreign Language Majors will be proficient in their respective languages.

Cadets will be able to

- (1) Comprehend and analyze language-based cultural products.
- (2) Read critically and analyze texts in the target language.
- (3) Communicate effectively using culturally appropriate forms in the target language.

### **Student Learning Outcome 2**

Foreign Language Majors will develop the cultural competence needed to interact effectively with members of the target community.

Cadets will be able to

- (1) Describe and explain crucial figures and events in the history of the target region.
- (2) Discuss significant recent cultural developments.
- (3) Analyze contemporary issues, guided by knowledge of the region's history.

(4) Account for limitations in existing conceptual frameworks as applied to cultural studies.

### **Student Learning Outcome 3**

Foreign Language Majors will be knowledgeable of the regional dynamics of LX-speaking countries.

Cadets will be able to

- (1) Describe the target region's armed forces.
- (2) State attitudes and beliefs of the LX-speaking population about the culture/policies of the US.
- (3) Summarize US policies related to the LX-speaking region.
- (4) Identify and explain sources of intercultural conflicts.

### **Student Learning Outcome 4**

Foreign Language Majors will be critical thinkers.

Cadets will be able to

- (1) Combine linguistic skills and critical thinking to perform research, conduct analysis, and deliver findings to diverse audiences.
- (2) Integrate acquired knowledge in foreign language studies with other humanities and social sciences disciplines.
- (3) Transfer language proficiency and intercultural capabilities to the study of and engagement with other language communities.
- (4) Recognize the inherent challenges of translation and literary analysis.
- (5) Navigate successfully the challenges of living in another culture.

---

## **Geography (GEO1 )**

**[DA CD: DFX - GEOGRAPHY,GENERAL / CIP CD: 45.0701 - Geography]**

Geography is the study of people, places, and the environment and is an ideal major for Cadets interested in the outdoors, global cultures, and the natural world. More specifically, Geographers examine spatial patterns, geographic processes, and natural and human landscapes. Geography is a broad, integrating discipline with methodologies and analytical foundations that span engineering, science, and the humanities. Majoring in Geography requires persistent curiosity and inquiry into human-land-environment interactions including an examination of how natural systems function, how physical landscapes evolve, how human populations adapt, and how humans shape the environment. Cadets explore cultural patterns, population trends, and political, economic, and social systems from a global and regional perspective. Geography majors also develop a greater depth of knowledge of the physical processes that shape the Earth, environmental changes and natural hazards, and anthropogenic pressures on natural resources and the environment. The major integrates the use of geographic skills such as computer cartography, remote sensing, and geographic information systems. Geography is the ideal discipline for an Army officer in a changing world.

Graduates with a major in Geography should be able to:

### **Student Learning Outcome 1**

Describe the development of geography and discuss the discipline's unique place within the social and natural sciences.

### **Student Learning Outcome 2**

Explain how geography connects both physical and human geographic principles in order to understand the interactions between people and the natural environment.

### **Student Learning Outcome 3**

Explain the fundamental concepts (place, space, scale, location, region, landscape) and theories that underlie modern thinking in geography.

### **Student Learning Outcome 4**

Explain the basic physical geography processes that affect human patterns & systems on the earth's surface.

### **Student Learning Outcome 5**

Demonstrate a basic competence in a technical skill of value to geographers, such as foreign language, research methodologies, or geospatial technologies.

### **Student Learning Outcome 6**

Use geospatial information sciences to inform understanding of geographic issues.

### **Student Learning Outcome 7**

Identify global cultural patterns and processes and summarize the regional geography of at least one world realm.

### **Student Learning Outcome 8**

Synthesize and apply knowledge of geography to better understand real world issues, including, but not limited to, topics of concern to the Army.

### **Student Learning Outcome 9**

---

Conduct basic geographic research, analyze the findings, and professionally communicate the results orally and in writing.

---

## **Geography: Human (GEH1 )**

**[DA CD: DFX - GEOGRAPHY,GENERAL / CIP CD: 45.0701 - Geography]**

Geography: Human (GEH0), Human-Environment (GEE0), Physical (GEP0)

This description and outcomes apply to all three tracks within the Geography major.

Geography is the study of people, places, and the environment and is an ideal major for Cadets interested in the outdoors, global cultures, and the natural world. More specifically, Geographers examine spatial patterns, geographic processes, and natural and human landscapes. Geography is a broad, integrating discipline with methodologies and analytical foundations that span engineering, science, and the humanities. Majoring in geography requires persistent curiosity and inquiry into human-land-environment interactions including an examination of how natural systems function, how physical landscapes evolve, how human populations adapt, and how humans shape the environment. Three tracks allow Cadets to explore geography through the major subfields of the discipline: Human Geography, Physical Geography, or Human-Environment Interaction. The Human Geography track provides a social science perspective that enables Cadets to explore cultural diversity, population trends, and political, economic, and social systems from a global and regional perspective. The Physical Geography track falls within the natural sciences and allows Cadets to develop a greater depth of knowledge on the physical processes that shape the Earth. The Human-Environment Geography track emphasizes the interaction between humans and their environment by delineating the regional challenges inherent with environmental change and natural hazards, identifying anthropogenic pressures on natural resources and the role these resources play in economic wellbeing, and understanding the environments role in regional instability. The major integrates the use of geographic skills such as computer cartography, remote sensing, and geographic information systems. Geography is the ideal discipline for an Army officer in a changing world.

Graduates with a major in Geography should be able to:

### **Student Learning Outcome 1**

Describe the development of geography and discuss the discipline's unique place within the social and natural sciences.

### **Student Learning Outcome 2**

Explain how geography connects both physical and human geographic principles in order to understand the interactions between people and the natural environment.

### **Student Learning Outcome 3**

Explain the fundamental concepts (place, space, scale, location, region, landscape) and theories that underlie modern thinking in geography.

### **Student Learning Outcome 4**

Explain the basic physical geography processes that affect human patterns & systems on the earth's surface.

### **Student Learning Outcome 5**

Demonstrate a basic competence in a technical skill of value to geographers, such as foreign language, research methodologies, or geospatial technologies.

### **Student Learning Outcome 6**

Use geospatial information sciences to inform understanding of geographic issues.

### **Student Learning Outcome 7**

Identify global cultural patterns and processes and summarize the regional geography of at least one world realm.

### **Student Learning Outcome 8**

Synthesize and apply knowledge of geography to better understand real world issues, including, but not limited to, topics of concern to the Army.

### **Student Learning Outcome 9**

Conduct basic geographic research, analyze the findings, and professionally communicate the results orally and in writing.

---

## **Geospatial Information Science (GIS2 )**

**[DA CD: BDF - GEOSPATIAL INFORMATION SCIENCE (GIS) / CIP CD: 45.0702 - Geographic Information]**

---

## Science and Cartography]

Fundamental to understanding our environment and the geography of the earth is our ability to locate, measure, and quantify geographic phenomena. The discipline of Geospatial Information Science is concerned with the measurement of the earth and all that is on it, natural and man-made. Cadets develop expertise in subjects ranging from traditional methods of land surveying to satellite imaging and positioning systems. The Geospatial Information Science curriculum builds on a firm math science, and geography foundation with specialized courses in land surveying, cartography, photogrammetry, remote sensing, and geographic information systems. Both the civil and military sectors of our society are placing an ever-increasing reliance on the ability to build and query GIS to support a myriad of social/economic and engineering issues. The cadet at the USMA has a rare opportunity to pursue an integrated field of study that is commonly spread over several separate disciplines at other institutions. This major has applicability for the future military officer regardless of branch. Cadets majoring in GIS receive a 3Y (Space Activities) Skill Identifier on their official military record. Additionally, cadets who branch Engineers will qualify for the Geospatial Engineer Officer Identifier. Cadets majoring in GIS also qualify for the United States Geospatial Intelligence Foundations Geospatial Intelligence Certificate.

### GIS Major Student Learning Outcomes and Supporting Objectives

#### Student Learning Outcome 1

Graduates will understand the fundamentals of geospatial data.

- a. Graduates will have an understanding of datums.
- b. Graduates will have an understanding of map projections.
- c. Graduates will have an understanding of map coordinate systems.

#### Student Learning Outcome 2

Graduates will be able to acquire geospatial data.

- a. Graduates will be able to plan a geospatial data collection or acquisition.
- b. Graduates will be familiar with the sources of geospatial data.
- c. Graduates will be able to collect geospatial data using traditional surveying techniques.
- d. Graduates will be able to collect geospatial data using GPS technologies.
- e. Graduates will be able to convert geospatial data to effectively meet project requirements.
- f. Graduates will be able to assess the quality of geospatial data.

#### Student Learning Outcome 3

Graduates will be able to effectively manage geospatial data.

- a. Graduates will be able to design a geospatial database that meets user requirements.
- b. Graduates will be able to build a geospatial database based upon design specifications.
- c. Graduates will be able to critically assess the utility of a geospatial database.
- d. Graduates will be able to modify the design and content of a geospatial database as necessary.

#### Student Learning Outcome 4

Graduates will be able to conduct geospatial analysis.

- a. Graduates will be able to generate digital elevation models.
- b. Graduates will be able to extract thematic data layers from remotely sensed imagery.
- c. Graduates will be able to conduct geospatial queries.
- d. Graduates will be able to take measurements of geospatial features.
- e. Graduates will be able to conduct basic geospatial analytical operations and methods.
- f. Graduates will be able to analyze geospatial surfaces.
- g. Graduates will be able to conduct basic network analysis.

#### Student Learning Outcome 5

Graduates will be able to effectively communicate with geospatial information.

- a. Graduates will understand and be able to use the principles of cartographic design.
- b. Graduates will be able to effectively employ geo-visualization techniques.
- c. Graduates will be able to communicate geospatial information in a non-graphic manner such as briefings and reports.

#### Student Learning Outcome 6

Graduates will understand the profession and responsibilities of the discipline.

- a. Graduates will have an understanding of legal, ethical, and security aspects of geospatial data and information.
- b. Graduates will be familiar with geospatial organizations with an emphasis on the Department of Defense and the U. S. Army.

---

## Geospatial Science (GSC0 )

[DA CD: BDF - GEOSPATIAL INFORMATION SCIENCE (GIS) / CIP CD: 45.0702 - Geographic Information Science and Cartography]

Fundamental to understanding our environment and the geography of the earth is our ability to locate, measure, and quantify geographic phenomena. The discipline of Geospatial Science is concerned with the measurement of the earth and all that is on it, natural and man-made. Cadets develop expertise in subjects ranging from traditional methods of land surveying to satellite imaging and positioning systems. The Geospatial Science curriculum builds on a firm math science, and geography foundation with specialized courses in land surveying, cartography, photogrammetry, remote sensing, and geographic information systems. Both the civil and military sectors of our society are placing an ever-increasing reliance on the ability to build and query GS to support a myriad of social/economic and engineering issues. The cadet at the USMA has a rare opportunity to pursue an integrated field of study that is commonly spread over several separate disciplines at other institutions. This major has applicability for the future military officer regardless of branch. Cadets majoring in GS receive a 3Y (Space Activities) Skill Identifier on their official military record. Additionally, cadets who branch Engineers will qualify for the Geospatial Engineer Officer Identifier. Cadets majoring in GS also qualify for the United States Geospatial Intelligence Foundations Geospatial Intelligence Certificate.

## GS Major Student Learning Outcomes and Supporting Objectives

### Student Learning Outcome 1

Graduates will understand the fundamentals of geospatial data.

- a. Graduates will have an understanding of datums.
- b. Graduates will have an understanding of map projections.
- c. Graduates will have an understanding of map coordinate systems.

### Student Learning Outcome 2

Graduates will be able to acquire geospatial data.

- a. Graduates will be able to plan a geospatial data collection or acquisition.
- b. Graduates will be familiar with the sources of geospatial data.
- c. Graduates will be able to collect geospatial data using traditional surveying techniques.
- d. Graduates will be able to collect geospatial data using GPS technologies.
- e. Graduates will be able to convert geospatial data to effectively meet project requirements.
- f. Graduates will be able to assess the quality of geospatial data.

### Student Learning Outcome 3

Graduates will be able to effectively manage geospatial data.

- a. Graduates will be able to design a geospatial database that meets user requirements.
- b. Graduates will be able to build a geospatial database based upon design specifications.
- c. Graduates will be able to critically assess the utility of a geospatial database.
- d. Graduates will be able to modify the design and content of a geospatial database as necessary.

### Student Learning Outcome 4

Graduates will be able to conduct geospatial analysis.

- a. Graduates will be able to generate digital elevation models.
- b. Graduates will be able to extract thematic data layers from remotely sensed imagery.
- c. Graduates will be able to conduct geospatial queries.
- d. Graduates will be able to take measurements of geospatial features.
- e. Graduates will be able to conduct basic geospatial analytical operations and methods.
- f. Graduates will be able to analyze geospatial surfaces.
- g. Graduates will be able to conduct basic network analysis.

### Student Learning Outcome 5

Graduates will be able to effectively communicate with geospatial information.

- a. Graduates will understand and be able to use the principles of cartographic design.
- b. Graduates will be able to effectively employ geo-visualization techniques.
- c. Graduates will be able to communicate geospatial information in a non-graphic manner such as briefings and reports.

### Student Learning Outcome 6

Graduates will understand the profession and responsibilities of the discipline.

- a. Graduates will have an understanding of legal, ethical, and security aspects of geospatial data and information.
- b. Graduates will be familiar with geospatial organizations with an emphasis on the Department of Defense and the U. S. Army.

---

## History Major: International (HNT3 )

[DA CD: EGX - HISTORY GENERAL / CIP CD: 54.0199 - History, Other]

This description and the outcomes apply to all history majors, not just History: International.

As Army officers, West Point graduates will perform a broad spectrum of missions vitally important to our nation's

security and interests. They must be intellectually and professionally prepared to face these challenges in an uncertain and dangerous world inhabited by peoples of different languages, religions, and cultures. The Department of History contributes to cadets' intellectual and professional development by imparting historical knowledge, an appreciation of history, and critical thinking and communication skills.

Broad historical knowledge is central to developing informed citizens and soldiers. It helps cadets place their service as future Army officers in the context of U.S., Western, and world history. Additionally, it provides the cultural and historical literacy necessary for officers to serve effectively wherever in the world they may find themselves. This is particularly true in the case of counterinsurgency warfare, where victory depends on achieving legitimacy in the eyes of the indigenous population.

Officers with an appreciation of history recognize that every situation is historically unique. They understand that history is of value not in divining answers about the future but in asking the right questions. History is the means of putting human activities and ideas in context, avoiding false analogies, lending a sense of scope and scale, assessing moral implications, anticipating unintended consequences, and judging the feasibility and suitability of possible courses of action. Consulting history on these issues helps officers arrive at thoughtful, appropriate, and humane solutions to the problems they will face in their careers.

Officers who are critical thinkers challenge accepted wisdom in the search for truth and justice. They are open-minded and able to make independent and informed decisions. They reject simplistic answers that suggest the existence of a black-and-white world; rather, they accept the ambiguity associated with most human endeavors and seek the best solution rather than a single "correct" one. The study of history encourages critical thinking by requiring cadets to:

- formulate critical questions;
- conduct research by gathering and prioritizing information; analyze information within the broad context in which it appears; interpret and synthesize information;
- derive reasoned, evidence-based conclusions;
- assess and adjust their conclusions as conditions change or new information becomes available.

Finally, officers must be able to communicate effectively, both orally and in writing, to influence others. It is of no use to know and appreciate history and to be able to think critically if the officer is incapable of communicating his or her thoughts. The Department of History develops cadets' communication skills through frequent practice in and out of the classroom. Our principal evaluative concern is the content of the message, but we also devote great energy to enabling cadets to communicate with grammatical correctness, stylistic grace, and acceptable format. Cadets may pursue a major in one of three fields: American History, International History, or Military History. Each offers flexibility, permitting cadets to develop a foundation of historical perspective as well as pursue specialized studies in regional areas, languages, or other disciplines.

### **Student Learning Outcome 1**

Communicate effectively in speaking and writing.

1. Demonstrate ability to read and understand information and arguments.
2. Demonstrate ability to understand and respond in verbal debate and discussion.
3. Convey ideas clearly, using conventions of format, structure, voice, tone, and level of formality appropriate to the rhetorical situation and audience in an organized way both orally and in writing.

### **Student Learning Outcome 2**

Understand how individuals, organizations, cultures, and societies behaved and met challenges in the past.

1. Identify and analyze the development of different cultures and civilizations and understand the historical foundations of their ethical development.
2. Analyze the interactions of political, social, economic, ethical, military, and cultural components in the development of civilizations.
3. Analyze and evaluate the role of historical insight in informing the decisions of political and military leaders.

### **Student Learning Outcome 3**

Understand the complexity and ambiguity of change over time. Evaluate complex evidence critically and establish appropriate links between cause and effect.

1. Use historical evidence to assess given situations both preceding and following historical change and describe the limits of that change, identify and analyze ethical components of historical events, identify conflicting points of view, analyze conflicting or ambiguous historical perspectives and evidence, establish causal relationships between facts, and identify points of tension.
2. Apply historical knowledge, critical thinking and research skills to inform their own professional decision-making.

### **Student Learning Outcome 4**

Demonstrate critical thinking and research skills:

1. Engage in independent research.

2. Identify the essential aspects of historical situations and ask relevant questions.
3. Reflect on and evaluate evidence and sources, question assumptions, synthesize and draw informed conclusions on the basis of critical analysis.
4. Employ historical thinking and analysis to explain historical patterns, developments and events.
5. Analyze various approaches to historical research and different historical frameworks.

## **International Affairs: FP & Security Studies (PIF0 )**

**[DA CD: EKB - INTERNATIONAL RELATIONS / CIP CD: 45.0901 - International Relations and Affairs]**

This description and outcomes apply to both the International Affairs: Foreign Policy & Security Studies and International Affairs: Institutions, Governance, and Development major tracks.

Students majoring in International Affairs (IA) study issues of conflict and cooperation in the international system. This involves examination of domestic influences on state behavior, the foreign relations of states, characteristics of the international system, characteristics of states, and the role of non-state actors. Central concerns in IA include power, strategy, war, international cooperation, governance, political institutions and structure, human security, civil society, trade, economic development, ideology, and culture. International Affairs majors think critically about complex political issues, they will learn how to test hypotheses using reliable methods and evidence, evaluate the moral dimension of issues in international relations and comparative politics, appreciate the problem of uncertainty and its significance, and see important events and issues from multiple perspectives. As a social science, IA is organized around alternative theoretical schools of thought that seek to explain international phenomena. The ability to understand, anticipate and shape the complex dynamics of the international environment (between and within states) is of direct relevance to U.S. Army officers, whose careers will be defined by the problems and opportunities that merge within the international system.

### **International Affairs Student Learning Outcomes**

#### **Student Learning Outcome 1**

SLO#1: Think Critically - Graduates can think critically about international affairs and regime types by applying and appreciating the value of intellectual pluralism.

#### **Student Learning Outcome 2**

SLO #2: Read Critically - Graduates can apply the social scientific method while consuming and analyzing international political, economic, and historical literature, including academic and popular writing as well as public discourse.

#### **Student Learning Outcome 3**

SLO #3: Conduct Research - Graduates can identify the social science methodologies appropriate for a given research question and will have the ability to conduct empirical research using these methodologies.

#### **Student Learning Outcome 4**

SLO #4: Gain Disciplinary Knowledge - Graduates can describe the major issues and variety of actors in international affairs and appreciate their incentives as well as the roles that they play in shaping international, regional, and country-specific events and developments.

#### **Student Learning Outcome 5**

SLO #5: Assess and Develop Policy - Graduates can integrate and apply knowledge to describe, explain, analyze, or predict international affairs and domestic political developments as well as identify implications and develop policy options.

#### **Student Learning Outcome 6**

SLO #6: Communicate Effectively - Graduates communicate with clear and effective analysis and arguments about complex international and global issues verbally and in writing.

## **Kinesiology (KIN1 )**

**[DA CD: FCB - OCCUPATIONAL THERAPY, KINESIOLOGY / CIP CD: 31.0505 - Kinesiology and Exercise Science]**

Kinesiology is the scientific study of human movement and is generally divided into the physiological, psychological, and mechanical aspects of movement. The physiological aspects of kinesiology encompass the study of the short-term responses and long-term adaptations of organisms and systems to the challenge of exercise, physical activity, or movement. From a neuromuscular perspective, kinesiology relates to how humans learn and control movements. The psychological aspects of kinesiology relate to the effects of human behavior on physical activity levels and performance. The mechanical aspects of kinesiology encompass the biodynamics of human movements as they relate

to exercise and human performance.

Kinesiology is a broad, interdisciplinary field of study that includes diverse specialties such as exercise physiology, biomechanics, nutrition, exercise psychology, and motor control. Areas of inquiry range in scope from the study of the molecular response of cells to the response and adaptation of the whole body. The kinesiology major encompasses a wide spectrum of performance-related issues involving muscular and cardiovascular physiology, energy balance, exercise adherence, skill acquisition, and fitness testing and prescription.

Upon completion, students will be able to:

**Student Learning Outcome 1**

Identify the anatomical structures that help determine physical competency and human movement

**Student Learning Outcome 2**

Describe the principles of human physical development and adaptation

**Student Learning Outcome 3**

Describe the musculoskeletal principles of work capacity

**Student Learning Outcome 4**

Identify the principles of the mechanics of human movement

**Student Learning Outcome 5**

Describe the principles of exercise psychology and their application to fitness

**Student Learning Outcome 6**

Apply the principles of fitness assessment and exercise prescription

**Student Learning Outcome 7**

Describe the nutritional concepts supporting the energy demands of physical training

## **Law and Legal Studies (LLS3 )**

**[DA CD: PXX - LAW,GENERAL / CIP CD: 22.0000 - Legal Studies, General]**

Law is the study of the means of maintaining social order, balancing individual interests against the interest of society, resolving disputes, and addressing social concerns. The study of law sharpens analytical and problem-solving abilities while developing an appreciation of law as a basic foundation of society. A Law and Legal Studies major will equip cadets with the means to understand conflicting issues, to analyze problems, and then to choose the most appropriate solution. The legal system major is not intended to train lawyers. Rather, it will prepare cadets for success in command or in any other position in which effective analytical, problem solving, and communications skills are essential. From this understanding cadets can expand their breadth of experience and gain insight into current social problems or future challenges. A Legal System major will enhance the ability to think critically, conduct research, and persuasively express oneself orally and in writing. Law provides an excellent preparation for subsequent graduate study in public policy and administration, politics, government, business management, and international relations.

### **Law and Legal Studies Major Student Learning Outcomes and Supporting Objectives**

**Student Learning Outcome 1**

Cadets understand how individuals and organizations use and react to law in the pursuit of social, political, and economic goals

a. Cadets will learn how to read and understand primary sources of American, foreign, and international law, including constitutions, codes, statutes, cases, regulations, and treaties.

b. Cadets will learn to analyze critically legal commentaries, including news reports, editorials, commentaries, documents, and law review articles.

**Student Learning Outcome 2**

Cadets communicate in correct and appropriate legal language when writing and speaking to evince clear and critical thinking.

a. Cadets will develop the oral and written skills to communicate concisely, persuasively, and logically to support or oppose a given decision or course of action.

b. Cadets will learn to apply legal texts and principles when analyzing specific problems and cases in order to reach legally and logically supportable conclusions and decisions.

**Student Learning Outcome 3**

Cadets identify the relationship between legal, ethical, and moral issues, and apply the law properly in decision-making. Cadets will be able to distinguish between the ethical, moral, policy, and legal components of social, political, and economic issues.

#### **Student Learning Outcome 4**

Cadets know how law affects and reflects diverse groups within American society to shape behavior, achievement, and ideas. Cadets will acquire a basic understanding of the substantive and procedural rules of law that underpin the American Legal System.

#### **Student Learning Outcome 5**

Cadets know how law is understood and applied in diverse global societies and cultures. Cadets will understand and internalize the values inherent in the principle of the rule of law as it is applied, or not applied, in a variety of cultures and circumstances.

#### **Student Learning Outcome 6**

Cadets think and act logically and creatively when acting within the framework and constraints of legal requirements. Students will acquire the legal knowledge and tools to function effectively as a military professional at all levels.

### **Mathematical Sciences (MSC1)**

**[DA CD: DHX - MATHEMATICS, GENERAL / CIP CD: 27.0101 - Mathematics, General]**

The mathematical sciences embody those areas of mathematics which have strong interdependence with other disciplines. Their purpose is to clarify concepts and describe scientific phenomena through symbolic language and the rules for its use. Its scope spans the total breadth of knowledge that is capable of being quantified. The full process of the mathematical sciences has expanded from their historical ties with the physical sciences to now include areas such as: the biological, sociological, behavioral, and computer sciences; operations research; and all engineering fields. The Department of Mathematical Sciences offers abundant opportunities for study in a broad range of mathematical subjects. Courses such as differential equations, algebra, mathematical modeling, analysis, numerical computation, statistics, and linear optimization provide a sound mathematical foundation in the science and engineering fields. In addition, follow-on courses such as algebra, analysis, combinatorics, and advanced individual study provide both depth in understanding the foundations of mathematical theory, as well as opportunity for study and research in a selected subject. Whenever possible, the use of technology is emphasized to extend the knowledge required for the consideration of realistic and challenging problems found in today's world. Cadets who major in Mathematical Sciences are required to take a seven-course core mathematics sequence, a statistics elective, an integrative experience course designed to explore real world problems pulled from many disciplines, and two additional mathematics electives for a total of eleven courses in the major. Mathematical Sciences majors are also required to take a three-course engineering sequence of their choice. Cadets will take MA205 - Calculus II as their STEM Depth choice in the core curriculum unless it is validated. Further, cadets will take a three-course Complementary Support sequence that provides breadth to their mathematical understanding (one of the three courses must be IT305 - Theory and Practice of Military IT Systems). Thus, Mathematical Sciences majors will take 41 courses while successfully completing their major and core curriculum requirements. The Mathematical Sciences with Honors major requires two semesters of directed research under senior faculty advisement that replaces the one semester research requirement, and culminates in a written thesis and presentation during the second semester. In order to receive the Mathematical Science with Honors Major, cadets will need to attain an APSC of at least 3.0 in the core curriculum and an APSC of at least 3.5 in the major curriculum.

Graduates who complete a Mathematical Sciences major will be able to:

#### **Student Learning Outcome 1**

Demonstrate competence in modeling physical, informational, and social phenomena by

- a. Identifying and articulating assumptions, metrics and constraints
- b. Applying appropriate solutions techniques
- c. Interpreting results within the appropriate context

#### **Student Learning Outcome 2**

Argue and inquire soundly and rigorously; become independent questioners and learners

#### **Student Learning Outcome 3**

Achieve mathematical proficiency in breadth and depth

- a. Understand and apply theorems and algorithms
- b. Understand and apply analytical methods
- c. Understand and apply numerical methods
- d. Understand and apply graphical methods
- e. Understand discrete and continuous structures and processes

#### **Student Learning Outcome 4**

Communicate mathematics, both orally and in writing

**Student Learning Outcome 5**

Use technology to model, visualize, and solve complex problems

**Student Learning Outcome 6**

Develop attitudes - habits of mind

- a. Creative and curious
- b. Experimental disposition
- c. Critical thinking and reasoning
- d. Commitment to life-long learning

**Student Learning Outcome 7**

Understand the role of mathematical sciences (in our world) by analyzing applied problems through disciplinary, multidisciplinary, and interdisciplinary approaches

---

**Mechanical Engineering (MEN3 )**

**[DA CD: CKX - MECHANICAL ENGINEERING / CIP CD: 14.1901 - Mechanical Engineering]**

Mechanical Engineering is one of the broadest and most diverse of the engineering fields. It deals with devices and systems for energy conversion, for material transport and for control of motion and forces. A sampling of the topics addressed by the discipline include air, ground, and sea vehicles; power plants; control systems; machinery; machine tools; conventional and nuclear-powered power production facilities; biomedical devices; space vehicles; pollution control; new energy sources; energy conversion; transportation systems; and, military weapons systems. These modern weapons systems are used as vehicles of instruction in many of the courses, making mechanical engineering particularly appropriate for those considering service in most branches of the Army as well as specialties such as engineers, aviation, research and development, project management and logistics. The Department of Civil and Mechanical Engineering offers a major in Mechanical Engineering that is accredited by the Engineering Accreditation Commission of ABET, <http://www.abet.org>. All cadets experience the same core mechanical engineering program and choose three electives for depth of study. The goal of the Mechanical Engineering program is to provide high quality instruction in a positive learning environment leading to a degree recognized as being among the best in the nation. The Mechanical Engineering program stresses engineering fundamentals so that graduates are well equipped to understand complex technical problems in a rapidly changing, technology-intensive Army. Once completed, the graduate is well-prepared to excel as an officer and an engineer. The practice-oriented degree is strengthened by the complete integration of design and laboratory experience throughout the curriculum.

To meet this goal, the Program Educational Objectives of the Mechanical Engineering program are:

Within a few years after graduation, mechanical engineering majors are expected to attain:

1. multiple positions of responsibility in which they:
  - a. drive outcomes
  - b. inform and influence others
  - c. build teams
2. personal and professional growth through formal and informal learning opportunities while being a role model to inspire others
3. experience in providing engineering expertise to the Army and Nation to design solutions and innovate for winning in a complex world

To achieve these Program Educational Objectives, cadets who qualify for graduation with a mechanical engineering major from USMA will demonstrate the following Mechanical Engineering Student Outcomes:

**Student Learning Outcome 1**

an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics.

**Student Learning Outcome 2**

an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors.

**Student Learning Outcome 3**

---

an ability to communicate effectively with a range of audiences.

**Student Learning Outcome 4**

an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts.

**Student Learning Outcome 5**

an ability to function effectively on a team whose members together provide leadership, create a collaborative environment, establish goals, plan tasks, and meet objectives.

**Student Learning Outcome 6**

an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions.

**Student Learning Outcome 7**

an ability to acquire and apply new knowledge as needed, using appropriate learning strategies

---

**Nuclear Engineering (NEN1 )**

**[DA CD: CLF - ENGINEERING,NUCLEAR / CIP CD: 14.2301 - Nuclear Engineering]**

Nuclear engineering makes practical use of the energy that is released by the atomic nucleus. Applications extend into the fields of electric power, medicine, nuclear weapons, and nuclear weapons effects. At USMA the vehicle for learning the concepts of the field is the commercial nuclear power plant. The approach is interdisciplinary; it draws widely upon mathematics, physics, and mechanics, with special emphasis on applied physics and the thermal-hydraulic aspects of mechanical engineering. The management of engineering is also addressed through decision analysis and economic analysis. The Nuclear Engineering major is designed to provide depth of knowledge in the application of nuclear energy to include power production, radiation health physics, nuclear weapons, and weapons effects. The major is taught through multiple departments and includes interdisciplinary electives from physics, mathematics, mechanical engineering, civil engineering, electrical engineering, and nuclear engineering. The Nuclear Engineering student will gain a broad background for further study in graduate school and Army assignments requiring expertise in mechanical engineering, applied radiation physics, nuclear weapons and weapons effects, or any of a variety of related topics. The Nuclear Engineering program is accredited by the Engineering Accreditation Commission of ABET, <http://www.abet.org>.

The Nuclear Engineering Program Educational Objectives are broad statements that describe what graduates are expected to attain within a few years after graduation. Program educational objectives are based on the needs of the Nuclear Engineering Program's constituencies.

- As Army leaders, graduates solve complex, multi-disciplinary problems for the Army and the Nation.
- Graduates demonstrate the necessary leadership and teamwork skills to work in multi-disciplinary team environments.
- Graduates are prepared to provide appropriate nuclear and radiological engineering expertise to the Army.
- Graduates communicate effectively, orally and in writing.
- Graduates continue to grow intellectually and professionally -- as Army officers and as engineers.

To achieve these Program Educational Objectives, cadets must attain or possess at graduation:

**Student Learning Outcome 1**

an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics.

**Student Learning Outcome 2**

an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors.

**Student Learning Outcome 3**

an ability to communicate effectively with a range of audiences.

**Student Learning Outcome 4**

an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts.

**Student Learning Outcome 5**

an ability to function effectively on a team whose members together provide leadership, create a collaborative environment,

---

establish goals, plan tasks, and meet objectives.

#### **Student Learning Outcome 6**

an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions.

#### **Student Learning Outcome 7**

an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

---

### **Operations Research (ORE2 )**

**[DA CD: CUC - OPERATIONS RESEARCH ANALYST,ENGINEERING / CIP CD: 14.3701 - Operations Research]**

Operations Research (OR) is a scientific approach to decision making with a focus on how best to design and operate systems, usually under conditions requiring the allocation of scarce resources. As a label for a body of methods or as an approach to problem solving, OR is inextricably linked to the direction and management of large systems for people, machines, materials, and money in government, industry, business, and defense. Since its formal inception during WWII, the interdisciplinary field of OR has set itself apart as an applied mathematical science and engineering discipline with a diverse range of applications. Cadets who major in Operations Research are required to take an 11-course core sequence, a two-course research sequence, an additional discipline elective, and a three-course Complementary Support Course sequence that provides breadth to their analytical understanding, for a total of 17 courses in the major. The embedded engineering courses in the major meet the goals of the core engineering sequence. For their STEM depth choice in the core curriculum, cadets majoring in OR will take MA205, Calculus II. Further, CY305: Theory and Practice of Military IT Systems, is required for Operations Research majors as a Complementary Support Course (CSC). In summary, Operations Research majors will take 41 courses while successfully completing their major and core curriculum requirements. In order to receive the Operations Research with Honors major, cadets will need to attain an APSC of at least 3.0 in the core curriculum, an APSC of at least 3.5 in the major curriculum, and take an additional elective course.

Graduates who complete an Operations Research major will be able to:

#### **Student Learning Outcome 1**

1. Demonstrate competence in modeling physical, informational, and social phenomena by:
  - a. Identifying and articulating assumptions, metrics, and constraints
  - b. Applying appropriate solution techniques
  - c. Interpreting results within the appropriate context

#### **Student Learning Outcome 2**

2. Argue and inquire soundly and rigorously; become independent questioners and learners

#### **Student Learning Outcome 3**

3. Achieve proficiency in Operations Research - in breadth and depth:
  - a. Understand and apply probabilistic and statistical models and methods
  - b. Understand and apply simulation methods
  - c. Understand and apply optimization methods

#### **Student Learning Outcome 4**

4. Communicate effectively - orally and in writing

#### **Student Learning Outcome 5**

5. Use technology to model, visualize, and solve complex problems

#### **Student Learning Outcome 6**

6. Develop attitudes - habits of mind
  - a. Creative and curious
  - b. Experimental disposition
  - c. Critical thinking and reasoning
  - d. Commitment to life-long learning

#### **Student Learning Outcome 7**

7. Understand the role of operations research in interdisciplinary problem solving
- 

### **Philosophy Major (PYL2 )**

**[DA CD: ALX - PHILOSOPHY / CIP CD: 38.0101 - Philosophy]**

The scope of Philosophy is much wider than the areas of Ethics and Just War theory studied in PY201. Besides Ethics, Philosophy investigates the very nature of human knowledge; the relationship between mind and matter; and fundamental principles of the kind that underlie religion, science, and politics. The study of Philosophy also has a significant cultural dimension. It challenges us to understand attitudes, beliefs and arguments from societies more or less remote from our own: the Greek and Roman world; the classical age of Asian thought; 17th-century European thought in its adjustment to modern science; and American contributions to our understanding of philosophical method. Doing Philosophy is a superior example of Critical Thinking at work, thanks to the high value it places in all its courses on systematic investigation, conceptual analysis, and cogent reasoning. West Point's Philosophy major is designed to ensure breadth and to encourage depth. It also provides opportunities to pursue further study in the ethics of war. The intellectual skills and experience that DEP's Philosophy major fosters are beneficial to the Army. The future officer in whom these skills take root will be an asset to any branch.

Cadets who major in Philosophy will be able to: analyze and construct philosophical arguments; show competency in logic and other core areas of philosophy; be familiar with major historical areas, figures, and problems of philosophy; understand philosophical ideas within their historical and cultural contexts; think and write in a rigorous and precise manner; use their critical thinking skills to provide original or innovative approaches to philosophical problems; apply philosophical methods in a variety of contexts at the personal and social levels; apply philosophical methods across disciplinary boundaries to a broad range of issues in the modern world.

### **Student Learning Outcome 1**

Philosophy majors will demonstrate the ability to think and write in a logically rigorous and conceptually precise manner about complex philosophical issues.

### **Student Learning Outcome 2**

Philosophy majors will understand major historical figures and problems in philosophy, underrepresented voices, and philosophical ideas within their historical and cultural contexts.

### **Student Learning Outcome 3**

Philosophy majors will be able to apply philosophical methods within the discipline and across disciplinary boundaries to issues and problems that individuals, communities, and governments face in the modern world.

### **Student Learning Outcome 4**

Philosophy majors will demonstrate competency in logic and other core areas of philosophy.

### **Student Learning Outcome 5**

Philosophy majors will use their critical thinking skills to provide creative approaches to theoretical and practical problems.

---

## **Physics (PHY1 )**

**[DA CD: DLX - PHYSICS,GENERAL / CIP CD: 40.0801 - Physics, General]**

Our modern lives have been overwhelmingly affected by the discoveries of physics in the twentieth century, for it is through physics that we have come to understand the fundamentals of nuclear energy, semiconductors, lasers, fiber optics, the interaction of radiation with matter, and even the workings of the universe. It is through this basic understanding that applied scientists and engineers have developed and assembled the myriad technical devices that are so much a part of modern life. The program in physics integrates all these phases of modern technology to develop a fundamental knowledge that can support a variety of technical interests and activities in future years. The major is designed to provide the Cadet a solid foundation in the essential pillars of theoretical physics-classical mechanics, electrodynamics, statistical physics, and quantum mechanics. Additionally, a strong experimental component emphasizes the skills necessary to design and build experimental apparatus and applies these skills to modern physics, lasers and optics. Opportunities are available to perform research at Army and national laboratories during the summer.

### **Physics Major Student Learning Outcomes and Supporting Objectives**

#### **Student Learning Outcome 1**

Cadets can apply the laws of physics to formulate mathematical models of physical systems, solve the resulting equations, and apply the solutions to hypothetical and real-world problems.

a. Cadets can use advanced mathematical methods to solve physics problems.

b. Cadets can identify situations in which relativistic effects are important and apply special relativity to solve mechanics problems.

- c. Cadets can apply Newtonian and Lagrangian mechanics to solve problems in classical physics.
- d. Cadets can solve problems involving electro- and magnetostatics.
- e. Cadets can solve problems involving electrodynamics in vacuum and in homogeneous linear media.
- f. Cadets can identify phenomena and solve problems involving thermodynamics and quantum statistical mechanics.
- g. Cadets can identify situations in which quantum mechanics is necessary and solve problems involving non-relativistic quantum mechanics.
- h. Cadets demonstrate proficiency across the range of skills and knowledge in theoretical physics and mathematics expected of entering graduate students in reputable physics programs.

#### **Student Learning Outcome 2**

Cadets can apply the laws of physics to formulate and test hypotheses in an experimental setting.

- a. Cadets can plan and perform experiments.
- b. Cadets can analyze experimental data.
- c. Cadets demonstrate proficiency across the range of skills and knowledge in experimental physics expected of entering graduate students in reputable physics programs.

#### **Student Learning Outcome 3**

Cadets can complete academic assignments and perform research using accepted ethical and scientific standards.

- a. Cadets provide sufficient citations and notes to clearly distinguish the Cadet's work from the work of others.
- b. Cadets avoid using or obscuring fallacious reasoning in the presentation of solutions to technical problems.
- c. Cadets are aware of acceptable scientific standards and the professional and/or personal consequences of not following them.

#### **Student Learning Outcome 4**

Cadets can communicate logical solutions to scientific and technical problems to superiors, peers, and subordinates.

- a. Cadets can prepare written submissions, posters, laboratory reports, and oral briefings using the style, format, organization, and procedures common to standard scientific presentations.
- b. Cadets can use sound mathematical reasoning, appropriate computational techniques, and statistical methods to explore, represent, and communicate solutions to problems.
- c. Cadets use precise and accepted scientific language in all technical communications.
- d. Cadets read and understand the content of general scientific publications such as *Scientific American* and *Physics Today*. They are able to follow citations to obtain background information on the material in the articles and summarize orally and in writing the strengths and weaknesses of the arguments presented in such publications to non-technical audiences.

#### **Student Learning Outcome 5**

Cadets can employ computing technology to explore analytic solutions, analyze data, create simulations, and present results.

- a. Exploration. Cadets can use computers, software, and programming skills to explore and gain physical insight into the behavior of analytic solutions to physics problems.
- b. Data Analysis. Cadets can use computers to acquire, record, process, and analyze data.
- c. Simulation. Cadets can translate physical models into computer simulations and compare the results to data.
- d. Visualization. Cadets can produce tables, plots, and figures suitable for publication in peer-reviewed journals.

### **Psychology: Applied General Psychology (PSA0 )**

**[DA CD: EPE - PSYCHOLOGY, APPLIED / CIP CD: 42.2813 - Applied Psychology]**

Psychology is one of four majors available through the Department of Behavioral Sciences and Leadership. Psychology is arguably one of the most applicable majors for future Army officers. Graduates gain specialized skills and knowledge related to understanding human behavior, making them uniquely prepared to understand and ultimately lead people. The study of psychology investigates human behavior, cognition, and emotion by analyzing the complex interactions between environmental, social, cultural, and biological influences. Opportunities are available during the summer to apply the lessons learned in the classroom in a variety of settings.

The Psychology major provides cadets a choice of two tracks:

The Applied General Psychology track is focused on applying knowledge of psychology to improve the development, performance, and well-being of individuals(soldiers).

The Organizational Psychology and Leadership track is focused on applying knowledge of psychology to select and develop leaders, and improve the effectiveness of groups, teams, and organizations.

#### **Psychology Major Student Learning Outcomes and Supporting Objectives**

##### **Student Learning Outcome 1**

1. Graduates demonstrate fundamental knowledge and comprehension of the major concepts, theoretical perspectives, historical trends, and empirical findings; and demonstrate the ability to apply their knowledge to address behavioral issues.
  - a. Describe key concepts, principles, and overarching themes in psychology.
  - b. Demonstrate a working knowledge of psychology's content domains.

c. In the Applied General Psychology Track, the emphasis is on applying knowledge of individual and social psychology to address issues relevant to the development, performance, and well-being of people (soldiers).

d. In the Organizational Psychology and Leadership Track, the emphasis is on applying knowledge of human behavior in organizations to: a) select and develop leaders/leadership, and b) enhance organizational effectiveness.

### **Student Learning Outcome 2**

2. Demonstrate scientific reasoning and problem solving skills, including effective research methods.

a. Demonstrate psychology information literacy; and use scientific reasoning to design and conduct basic psychological research, interpret data, and draw appropriate conclusions about psychological phenomena.

b. Engage in innovative and integrative thinking and problem solving.

c. Graduates incorporate sociocultural factors in scientific inquiry.

d. Applied General Psychology Track: the emphasis is on critical thinking in the application of psychological research; and on conducting empirical research studying issues pertinent to the development, performance, and well-being of people.

e. Organizational Psychology and Leadership Track: the emphasis is on critical thinking in the application of research and other writings pertinent to human behavior in organizations; and on conducting empirical research studying issues pertinent to leadership and organizational effectiveness.

### **Student Learning Outcome 3**

3. Graduates demonstrate ethically and socially responsible behaviors for professional and personal settings in a landscape that involves increasing diversity.

a. Graduates apply ethical standards to evaluate psychological science and practice.

b. Graduates build and enhance interpersonal relationships

c. Graduates embrace values consistent with the professional military ethic, which contribute to positive outcomes in work settings and in building a society responsive to multicultural and global concerns.

### **Student Learning Outcome 4**

4. Graduates demonstrate competent written, oral, and interpersonal communication skills.

a. Graduates demonstrate effective writing and presentation skills for different purposes (e.g., they can produce a research study; and present information to a professional audience or decision maker).

b. Graduates interact effectively with others for different purposes (e.g. they demonstrate relevant skills such as counseling, coaching, and/or negotiations).

### **Student Learning Outcome 5**

5. Graduates apply psychology-specific content and skills, effective self-reflection, project-management skills, teamwork skills, and career preparation.

a. Graduates apply psychological content and skills to career goals.

b. Graduates exhibit self-efficacy and self-regulation.

c. Graduates effectively manage individual and team projects and professional requirements.

d. Graduates are inspired to life-long learning in disciplines pertinent to psychology and leadership.

## **Space Science (SSC0 )**

**[DA CD: SSC - SPACE SCIENCE / CIP CD: 29.0305 - Space Systems Operations]**

Our modern lives have increasingly benefitted from the knowledge of the space environment, utilization of satellites and spacecraft, and application of space-based technologies in the 21st century. Space Science is the science of the space environment as well as the science behind the technology of spacecraft, satellites, and space exploration. Some of those technologies and systems that society has benefitted from include: space weather and terrestrial weather forecasting satellites; position, navigation, and timing (PNT) enabled devices such as GPS; satellite communications; missile defense systems; and remote sensing systems used to observe our planet, our heliosphere, and beyond our solar system. Through the understanding of the aforementioned technologies and systems, space scientists develop and assemble a myriad of technical devices that are so much a part of a modern space-enabled profession. The program in Space Science integrates all these facets of space-enabled technology to develop a fundamental knowledge that can support a variety of technical interests and activities in future years. The major is designed to provide the cadet a solid foundation in orbital mechanics, the space environment, attitude determination and control, satellites communications, space structures, astronomy, astrophysics, space physics, remote sensing, and rocket propulsion. Opportunities are available to perform research at DoD and other laboratories that conduct space and missile defense related research during the summer.

### **Space Science Major Student Learning Outcomes**

#### **Student Learning Outcome 1**

1. Cadets can apply mathematical and scientific knowledge to identify, formulate, and solve Space Science problems.

#### **Student Learning Outcome 2**

2. Cadets can conduct experiments, apply the scientific method, as well as analyze and interpret data.

---

**Student Learning Outcome 3**

3. Cadets can function on multidisciplinary teams to effectively formulate, state, describe, summarize, and communicate contemporary space issues, National Strategic Space Policy and associated technology; analyze and examine the professional and ethical aspects of the aforementioned.

**Student Learning Outcome 4**

4. Cadets can describe and summarize the technology of a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability.

**Student Learning Outcome 5**

5. Cadets can recognize the need for, and an ability to engage in life-long learning; explain relevant, contemporary issues and concepts needed as a space-enabled professional.

---

**Systems and Decision Sciences (SDS0 )**

**[DA CD: BBR - SYSTEMS MANAGEMENT / CIP CD: 30.0601 - Systems Science and Theory]**

The Systems and Decision Sciences (SDS) discipline is concerned with system design, management, and decision analysis of tangible and abstract systems in accordance with performance requirements, budget, and schedules. The program combines elements of traditional engineering, systems engineering, finance, decision analysis, and organizational management courses. Cadets will learn the methods, processes, and tools (MPTs) needed to understand and conduct meaningful decision analysis in support of complex systems. These large systems require an interdisciplinary approach rooted in technical, management, and leadership skills. Industry and domain based concentrations are available, to include Project Management, Logistics Management, Personnel Management, Defense Systems, Financial Systems, Cyber Security, Management Science, International Affairs, and Mathematical Modeling. Systems and Decision Sciences graduates are ready to lead multidisciplinary teams, perform systems thinking, and understand the MPTs needed to model complex, ill-defined, and interdisciplinary problems characterized by global, political, social, military, economic, and technological challenges. A culminating real-world, year-long capstone is required to employ the MPTs associated with complex systems and address issues, such as stakeholder analysis, analytical methods, project and cost management, and the political, social, and environmental, etc., realities of working on large, ill-defined, interdisciplinary problems. This major will produce graduates with technical, high-level business and management skills, and engineering depth to prepare them for future academic and professional opportunities in a society increasingly dominated by technological change.

Each graduate will be able to:

**Student Learning Outcome 1**

Use systems and decision science methods, processes, and tools (MPTs) to solve diverse problems in engineering and non-engineering domains, while considering moral and ethical standards specific to the locale.

**Student Learning Outcome 2**

Employ systems thinking to identify, scope, understand, analyze problems, and specify the needs of multiple stakeholders.

**Student Learning Outcome 3**

Develop innovative system solutions based upon sound decision science techniques and clearly articulate the results to all stakeholders.

**Student Learning Outcome 4**

Perform systems decision-making that considers qualitative and quantitative aspects of the problem.

**Student Learning Outcome 5**

Accurately, clearly, concisely, and persuasively report findings, conclusions, and recommendations to the stakeholders in a multicultural context.

**Student Learning Outcome 6**

Lead interdisciplinary teams to implement effective and efficient solutions by melding traditional and non-traditional engineering domains.

**Student Learning Outcome 7**

Demonstrate the skills and interest for intellectual growth and learning for a career of professional excellence and service to the nation as an officer in the United States Army.

---

**Systems and Decision Sciences (SDS1 )**

---

**[DA CD: BBR - SYSTEMS MANAGEMENT / CIP CD: 30.0601 - Systems Science and Theory]**

The Systems and Decision Sciences (SDS) discipline is concerned with system design, management, and decision analysis of tangible and abstract systems in accordance with performance requirements, budget, and schedules. **Student Learning Outcome 6**

Lead interdisciplinary teams to implement effective and efficient solutions by melding traditional and non-traditional engineering domains.

**Student Learning Outcome 7**

Demonstrate the skills and interest for intellectual growth and learning for a career of professional excellence and service to the nation as an officer in the United States Army.

---

**Systems Engineering (SEN1 )****[DA CD: CUX - SYSTEMS ENGINEERING / CIP CD: 14.2701 - Systems Engineering]**

Systems Engineers innovatively solve large, complex problems in a technologically advanced environment by engineering solutions which provide significant value to clients and their organizations. Systems Engineers also lead interdisciplinary teams of engineers and others in the development and implementation of technical solutions to complex issues facing organizations. Systems Engineering majors learn to think systematically, engineer systematically, and approach decisions systematically. The Systems Engineering program is accredited by the Engineering Accreditation Commission of ABET, <http://www.abet.org>.

Thinking systematically involves understanding the entire environment in which the system operates and includes the needs, wants, and desires of all the stakeholders of the system. Engineering systematically involves identifying and understanding the required system functions, developing alternative system solutions, and applying the basic modeling and simulation tools required to analyze the system from an engineering perspective. Approaching decisions systematically involves leading and participating in multi-disciplinary teams to innovate and implement visionary

solutions to these complex problems.

The recent rapid growth and success of systems engineering can be attributed to advances in technology and the transition of society to a highly networked, globally-oriented information age which results in a dramatic increase in the complexity of problems. These problems require systems thinking and a holistic approach to problem solving that is at the heart of the systems engineering discipline. It is the challenge of systems engineers to harness and direct technology toward solving problems most often related to processes and operations. Ultimately, the study and application of systems engineering principles involve innovation and the creative application of analytical models to facilitate sound decision making.

**Systems Engineering Program Educational Objectives:** Within 5 to 7 years of graduation each graduate of the Systems Engineering program will have:

1. Effectively led interdisciplinary teams to solve complex problems.
2. Demonstrated intellectual growth and continued self-improvement through self-study, continuing education, or professional development.
3. Fostered an organizational ethos that promotes the professional, moral, ethical, and respectful treatment of all.
4. Analyzed, designed, implemented, and maintained systems throughout their lifecycles.
5. Clearly communicated engineering solutions and analysis to leaders, both orally and in writing, to enable sound decision-making in the presence of uncertain, biased, or confounding influences.
6. Approached problems holistically while recognizing each system as a whole, with its fit and relationship with the environment being primary concerns.

**Systems Engineering Student Outcomes:** To achieve these objectives, cadets will demonstrate the following Systems Engineering Student Outcomes at the time of graduation:

**Student Learning Outcome 1**

an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics.

**Student Learning Outcome 2**

an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors.

**Student Learning Outcome 3**

an ability to communicate effectively with a range of audiences.

**Student Learning Outcome 4**

an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts.

**Student Learning Outcome 5**

an ability to function effectively on a team whose members together provide leadership, create a collaborative environment, establish goals, plan tasks, and meet objectives.

**Student Learning Outcome 6**

an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions.

**Student Learning Outcome 7**

an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

### **War Studies Major (WST0 )**

**[DA CD: BDH - WAR STUDIES / CIP CD: 45.0999 - International Relations and National Security Studies]**

War Studies at USMA is an academically integrated interdisciplinary program dedicated to the study of war, strategy, and warfare in three frames: past, present, and future. It rests upon a foundation of a set of War Studies disciplinary courses that synergistically combine history with theory using the Clausewitzian methodology that blends theory and application, complemented by interdisciplinary and single-discipline courses from a range of fields, especially Military

History and Strategic Studies. War Studies at USMA is interdisciplinary in its synthesis and application of multiple disciplines in ways that foster a deeper understanding of war and prepare cadets to plan, direct, and lead in war. Graduates will be well practiced in thinking about war, strategy, and warfare in time and context, finely attuned to the role of contingency in war, and uniquely capable of developing and articulating flexible strategies and plans that reflect both rigorous analysis and wisdom. Ultimately, War Studies majors will be able to integrate knowledge and skills from a variety of disciplines to anticipate and respond appropriately to opportunities and challenges in a changing world.

The War Studies program achieves this vision through the following Student Learning Outcomes:

**Student Learning Outcome 1**

Communicate effectively in speaking and writing.

**Student Learning Outcome 2**

Analyze and explain how theory, strategy, and warfare have evolved over time; and assess their future trajectories.

**Student Learning Outcome 3**

Evaluate war, strategy, and warfare using appropriate interdisciplinary lenses.

**Student Learning Outcome 4**

Analyze the relationship between societies, institutions, war, strategy, and warfare.

**Student Learning Outcome 5**

Demonstrate critical thinking and research skills reflecting a range of methodologies.

| <p>This course is designed to improve cadets' understanding of human behavior in small group/team settings. Course content includes structural characteristics of teams such as size, status, roles and norms in addition to the effects of team tasks and environment. Cadets then use their understanding of these constructs to analyze team phenomena such as cohesion, performance, decision making, problem solving, and conflict resolution. We also devote a number of lessons to current issues such as electronic and virtual groups, high performance work teams, and shared leadership in a team environment. The course is particularly relevant to professional development in that cadets gain a comprehensive understanding of the dynamics of small group and team interaction. This allows them to develop and implement creative leader actions that will maximize unit/team effectiveness. This course is required for cadets pursuing the Management major.</p>                                        |                            | 2026-1 2027-1 2028-1<br>2029-1               |

| <p>This course introduces cadets to the core concepts, tools, and strategies of marketing management, with a focus on applying theory to real-world problems in both military and civilian contexts. Cadets will develop critical thinking and analytical skills through case studies, market-based scenarios, and applied projects that reflect contemporary marketing challenges. Emphasis is placed on understanding the marketing manager's role within organizations and their contribution to strategic decision-making. The course also integrates insights and best practices from industry leaders to prepare cadets for leadership roles in a rapidly changing global economy. This course is required for cadets pursuing the Management major.</p>                                                                                                                                                                                                                                                              |                            | 2026-2 2026-8 2027-2<br>2028-2 2029-2 2029-8 |

| <p>This course serves a dual purpose. It is an introduction to the concept of management as well as an introduction to the multidisciplinary nature of the management field of study. It is designed to give cadets a foundation on which to build deeper areas of expertise across the different business disciplines, including marketing, accounting, finance, operations, human resources, and entrepreneurship. This course also focuses on decision making and the managerial activities that organizational leaders use to effectively and efficiently direct the resources of organizations. As a result, the course is structured around the traditional management functions of planning, organizing, leading, and controlling. In addition, cadets will examine the concepts of ethical and global management as they learn to analyze operating environments, assess organizational capabilities, and develop feasible courses of action. This course is required for cadets pursuing the Management major.</p> |                            | 2026-1 2026-8 2027-1<br>2028-1 2029-1 2029-8 |

| <p>This course begins with the premise that people are a firm's most important resource, and that the management of this critical resource ultimately determines the success or failure of the organization. This class exposes cadets to theories and concepts of Human Resource Management (HRM). More broadly, it encompasses topics associated with strategically managing human capital to support the performance objectives of an organization. This course combines explanations of theory with practical lessons that help frame decision making related to HR issues from the perspective of a General Manager (GM). By analyzing HRM practices and organizational outcomes through presented theory and case studies, cadets learn how to apply HRM concepts to positively influence the success of any organization. This course is required for cadets pursuing the Management major.</p>                                                                                                                      |                            | 2026-1 2027-1 2028-1<br>2029-1 2029-8        |

**Scope:** 2026-1

**Offerings:**

This course immerses cadets in fundamental-level negotiations and bargaining theory and application. The course progresses from dual-party, single-issue, distributive scenarios to multi-party/multi-issue/integrative scenarios. Cadets learn and practice systematic ways to devise an effective strategy prior to entering a negotiation and then actually apply bargaining tools and tactics during the negotiation to accomplish their individual and organizational goals. Cadets learn concepts and frameworks that help them analyze and understand human behavior so that they have a perspective from all parties involved in a negotiation. Examinations are behavioral and written. Emphasis is placed on applying the behavioral principles learned to real-world issues and their impacts on functioning as future Army officers.

|--------------|-----------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-2

**Offerings:**

The purpose of MG395 is to provide and integrate the analytical tools learned in this and other courses in a management setting. Specifically, this course will provide the fundamentals of understanding, developing, and analyzing financial statements (income statement, statement of retained earnings, balance sheet, and statement of cash flows), using accounting ratio analysis, analyzing inventory, understanding costing systems, and budgeting. By applying the various accounting techniques in a managerial setting, cadets will be better prepared to quantitatively support their managerial decisions. This course is required for cadets pursuing the Management major.

|--------------|---------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

The purpose of MG410 is to provide Management majors with the basic principles of managerial finance, and then to apply these principles in the context of managerial decision-making. Specifically, this course will cover: the fundamentals of the time value of money; the meaning and measurement of risk and return; valuation techniques for stocks and bonds; and standard techniques for financial analysis, to include capital budgeting, discounted cash flow valuation, and weighted average cost of capital. Cadets will leave this course with a solid understanding of how financial managers at the corporate level balance risk and return and thus manage everyday financial decision-making. This course is required for cadets pursuing the Management major.

|--------------|------------------------------|----------------------------------------------------------|

---

**Scope:** 2010-1

**Offerings:**

The purpose of MG420 is to provide cadets with the tools to deal with the quantitative aspects of design and analysis of operations management. Emphasis is on identification, analysis, and solution of production problems using applied quantitative techniques using the case study technique. In addition to case studies, simulations reinforce the problem-solving techniques necessary for today's successful managers. Specific methods and techniques taught and applied are operations strategy, product design and selection, supply chain management, total quality management, forecasting, capacity planning, facility location, facility layout, work system design, inventory management, material requirements planning, and scheduling. This course is required for cadets pursuing the Management major.

| <p>This capstone course for Management majors emphasizes the integration of concepts and principles found in all previous management courses as they relate to the strategic management of public, private, and military organizations. This course focuses on all aspects of the strategic management process to include: the identification of opportunities and threats in a competitive environment, the development of organizational core competencies, and the strategic alternatives available to organizations as they seek to achieve their goals in a highly dynamic operating environment filled with complexity, uncertainty, and risk. MG421 uses the case study method that requires comprehensive, in-depth analysis of realistic management situations. This course is required for cadets pursuing the Management major.</p>                                                                                                                                                                                                                 |                                                                                                                                                                                                          | 2026-2 2026-8 2027-2<br>2028-2 2029-2                         |

| <p>The Army, like many organizations, exists in a volatile, uncertain, complex, ambiguous, and uncertain (VUCA) global environment, and cadets will be required to lead organizations in this dynamic set of circumstances. An entrepreneurial mindset is a key element of success in such environments. In this course, cadets will develop an understanding of the ways that innovation and entrepreneurship can manifest in conventional and unconventional settings. For the capstone project, cadets will develop a commercially viable business idea and compete with that idea in the Mid-Hudson Regional Business Plan Competition, which will take place in March. If any individual cadet or team place first or second in the Mid-Hudson Regional Business Plan Competition, then they will be propelled into the qualifying rounds for the New York State Business Plan Competition. The qualifying rounds take place in April, and if selected, cadets will compete with their idea at the New York State Business Plan Competition in April.</p> |                                                                                                                                                                                                          | 2026-2 2027-2 2028-2<br>2029-2                                |

| <p>Agile Innovation in Defense (AID) is an experiential educational model that engages teams of Cadets to solve some of the nation's toughest national security and defense problems using lean startup principles. With more than 80 U. S. government organizations and agencies acting as problem sponsors, AID addressed national security and defense problems with the aid of coaches, instructors, and support personnel from National Security Innovation Network (NSIN). Cadets work in teams on curated problems, interfacing directly with problem sponsors with leadership roles in the Department of Defense. Through iterative problem solving, Cadets hone problem-solving skills, learn about high-priority problems in the Department of Defense, and build relationships among subject matter experts and stakeholders.</p>                                                                                                                                                                                                                   |                                                                                                                                                                                                          | No Course Offerings                                           |

| Psychology as a discipline is both a natural and social science that involves the study of the brain, mind, and behavior. General Psychology for Leaders is a course that involves a multidisciplinary study of the human dimension, behavioral sciences, and leadership development. The course examines the cognitive, physical, and social components of the human dimension using the scientific method to promote reflection, development, ethical reasoning, and critical and creative thinking. The learning outcome is that each cadet will be more ethical and effective leader because of a scientific understanding of human behavior. Emphasis is placed on applying the behavioral principals learned to the cadets' current lives and their functioning as future officers. The two course goals are that cadets apply the scientific method to investigate causes or correlates of human behavior, and that they use this scientific understanding of human behavior to explain, predict, and change behavior to become an effective leader of character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                           | 2026-1 2026-2 2026-4<br>2027-1 2027-2 2027-4<br>2027-5 2028-1 2028-2<br>2028-4 2028-5 2029-1<br>2029-2 2029-4 |

| Psychology as a discipline is both a natural and social science that involves the study of the brain, mind, and behavior. Advanced General Psychology for Leaders is a course that involves an advanced multidisciplinary study of the human dimension, behavioral sciences, and leadership development. The course examines the cognitive, physical, and social components of the human dimension using the scientific method to promote reflection, development, ethical reasoning, and critical and creative thinking. The learning outcome is that each cadet will be a more ethical and effective leader because of a scientific understanding of human behavior. With even more leader development application than PL100, emphasis is placed on applying the behavioral principles learned to the cadets' current lives and their functioning as future officers. The two course goals are that cadets apply the scientific method to investigate causes or correlates of human behavior, and that they use this scientific understanding of human behavior to explain, predict, and change behavior to become an effective leader of character. This course goes beyond PL100 (General Psychology for Leaders) in that students are asked to apply material at a higher level via reading and incorporating significant peer-reviewed research to address real-world Army issues. Students must also communicate their understanding of psychology and how it informs their roles as leaders of character via formal and informal presentations. |                                           | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2                                                 |

| This course offers an introduction to cognitive neuroscience: the interdisciplinary study of how brain structure and function give rise to behavior and mental processes. We examine the biological bases of behavior through topics such as perception, learning, memory, language, emotion, motivation, sleep, development, psychopathology, and more. Together, we investigate how the brain's structure and activity develop, adapt, and interact to support complex behavior, and how disruptions to these processes impact functioning. The knowledge and skills developed in this course help establish a critical foundation in neurocognition for advanced study and professional practice across many disciplines such as psychology, medicine, education, and human performance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                           | 2026-1 2027-1 2028-1<br>2029-1                                                                                |

| This course is an individually supervised research and study program. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty member. Activities vary by project, but the primary purpose is for the cadet to engage in independent study and produce a work of scholarship. With the approval of one of the Program Directors in the Department of Behavioral Sciences and Leadership, the cadet chooses a project of interest and is supervised by a faculty member. Cadets are expected to perform an average of 2 hours of work per week towards completion of the project, for a total of 40 hours of work.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                           | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2                                                 |

**PL300** **MILITARY LEADERSHIP** **3.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2026-1 **Offerings:**

PL300 (Military Leadership) is a multidisciplinary study of leadership within military organizations. Cadets gain a theoretical and pragmatic understanding of the behavioral and organizational sciences, which they apply to develop their own leadership skills, cultivate leadership abilities in others, and enhance the effectiveness of military organizations. The course surveys a carefully selected set of the most relevant and useful ideas, concepts, theories and knowledge from these sciences. A representative list of topics explored includes: leadership development, character and its development, power and influence, team dynamics, organizational change, and transformational leadership. In addition to applying knowledge of these topics, cadets develop a leadership portfolio which helps refine and inform their personal approach to leading. The portfolio includes several assignments that require personal reflection, critical thinking, and mentor engagement. PL300 is designed to maximize cadets' practical application of theory in their roles as leaders in the Corps of Cadets and as future Army officers.

**Lessons:** 29 @ 75 min (2.500 Att/wk) **Labs:** 1 @ 75 min

**Special Requirements:** None

**Prerequisite(s):** PL100  
-Or-  
PL150

**Disqualifier(s):** PL350

**PL350** **ADVANCED MILITARY LEADERSHIP** **3.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2026-1 **Offerings:**

PL350 (Advanced Military Leadership) is a multidisciplinary study of leadership within military organizations. Cadets gain a theoretical and pragmatic understanding of the behavioral and organizational sciences, which they apply to develop their own leadership skills, cultivate leadership abilities in others, and enhance the effectiveness of military organizations. The course surveys a carefully selected set of the most relevant and useful ideas, concepts, theories and knowledge from these sciences. A representative list of topics explored includes: leadership development, character and its development, power and influence, team dynamics, organizational change, and transformational leadership. In addition to applying knowledge of these topics, cadets develop a leadership portfolio which helps refine and inform their personal approach to leading. The portfolio includes several assignments that require personal reflection, critical thinking, and mentor engagement. PL350 is designed to maximize cadets' practical application of theory in their roles as leaders in the Corps of Cadets and as future Army officers. PL350 offers some advanced topics and experiential opportunities beyond that of PL300. Enrollment is limited to cadets recognized as having exceptional leadership potential within the Corps.

---

**Scope:** 2026-1

**Offerings:**

This course focuses on the psychological components, theories, and skills that support sustained elite performance. The goal of the course is to foster cadets' understanding, development, implementation, and coaching of the psychological skills that influence and generate success in high-level performance situations across domains (academic, physical, athletic, military, and leadership). Topics include performance mindset and awareness, psychological skills training fundamentals, confidence and self-talk, motivation and goal setting, attention control, energy and stress management, mindfulness, imagery, and special topics related to performance psychology. Throughout the course, particular emphasis is placed on how these topics relate to and can be applied in cadets' roles as current and future leaders. Cadets will both understand theoretical bases underlying these topics, and apply them, through applied mental training exercises, leading and taking part in squad discussions on the course topics applied to leadership specifically, and through a semester-long peer mentorship case study with a fellow cadet.

**Scope:** 2026-1

**Offerings:**

This course introduces cadets to the foundational principles and practices of scientific research in the behavioral sciences. Cadets will explore the philosophy and terminology of the scientific method, gaining a solid understanding of essential research concepts. The course covers a range of research designs, including both experimental and non-experimental methodologies, to illustrate how different approaches shape the study of behavior. Cadets will also learn basic data analysis techniques, including both descriptive and inferential statistics. Throughout the course, cadets will apply their knowledge by working in groups to design and conduct research projects using observational methodologies on topics of their choice.

| Qualitative Research Methods facilitates discussion, awareness, and understanding of social research methodology. In this course we seek to understand the basics of social research with a specific focus on qualitative social research methods. This objective is achieved through discussions, applications, and demonstrating the ability to solve social problems via viable social research. This includes the development, design, and application of several analysis papers, culminating in a written research proposal and an oral presentation. Methods covered include ethnography, interviewing, content analysis, (un)obtrusive measures, visual analysis, and ethics.                                                                                                                                                                                                                                                                                                                                                                            |                                                                       | 2026-2 2027-1 2028-1 2029-1                        |

| This course introduces the scientific study of society and the interactions among people within American society. Providing a broad introduction to American social ideals and civic responsibilities, the course then explores civic and lived life. Through sociological analysis of social institutions and their impact on individuals, cadets will identify patterns across situations and determine the social significance of our modern institutions, including government, family, schools, and the military. This course includes writing, discussions, exams, presentations, and hands-on projects. **This is a pilot course that must be reviewed by the Curriculum Committee NLT AY28-1 to continue.**                                                                                                                                                                                                                                                                                                                                              |                                                                       | 2026-2 2027-2 2028-2                               |

| Sociology is the scientific study of society and the interactions among humans. The goal of Introductory Sociology is to provide a survey of the field of sociology and educate and inspire cadets to examine contemporary situations that involve social interaction and use sociological concepts, theories, and research to explain what is taking place, identify social threads and patterns across the situations, and determine the personal as well as the social significance of their analysis. Sociology demands that the student transcend the taken-for-granted, subjective world view and develop a sociological imagination by revealing the linkages and relationships among social facts and connect public issues to self awareness. PL371 is a survey course with the identification of common threads across social situations, and determining the self and social significance of facts. The teaching and learning strategy involves reading, writing, discussions, presentations, and other active-learning, hands and heads-on projects. |                                                                       | 2029-1 2029-2                                      |

| This course offers a multidisciplinary examination of contemporary American families, with a special focus on the unique experiences of military families. Grounded in a sociological perspective, the course integrates insights from psychology, history, anthropology, biology, and economics to deepen understanding of the family as a social institution and its interactions with other institutions such as work, education, and the military. Cadets will analyze the historical and current forces shaping families, with particular attention to the challenges and dynamics faced by military families. Through the evaluation of contemporary issues, policies, and scholarly research, cadets will apply scientific inquiry and critical thinking to assess and anticipate the evolving roles and needs of American military families.                                                                                                                                                                                                             |                                                                       | 2026-2 2027-2 2028-2 2029-2                        |

| <p>This course examines individual development and the forces that shape human growth from birth to late life, including death, and bereavement. Cadets will explore development through multiple theoretical perspectives, emphasizing physical, cognitive, and socioemotional changes across the lifespan. Topics include moral development, self-concept, identity formation, and the influence of family and society. Special attention is given to the application of developmental principles in military contexts, preparing cadets to understand and lead individuals from various backgrounds, foster resilience, and support the well-being of those under their command throughout their military careers.</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)    <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> None</p>                                                                                                                                                                                                                                                              |                            | 2026-1 2027-1 2028-1<br>2029-1                                                                         |

| <p>This course introduces cadets to the study of psychological disorders, with a focus on understanding the defining characteristics of a range of mental health conditions. Cadets will explore how these disorders develop and are maintained, as well as evidence-based approaches to their treatment. The course examines psychological disorders from multiple theoretical perspectives, including genetic, biological, cognitive, behavioral, sociocultural, and psychoanalytic viewpoints. Through this comprehensive approach, cadets will gain the knowledge and skills necessary to recognize, understand, and address mental health challenges within military and broader contexts.</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)    <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> A case study paper that provides an in-depth analysis of a selected psychological disorder.</p>                                                                                                                                                                                             |                            | 2026-2 2027-2 2027-8<br>2028-2 2028-8 2029-1<br>2029-2 2029-8                                          |

| <p>This course is designed to improve cadets' understanding of human behavior in small group/team settings. Course content includes structural characteristics of teams such as size, status, roles and norms in addition to the effects of task and environment. Cadets then use their understanding of these constructs to analyze team phenomena such as cohesion, performance, decision making, problem solving and conflict resolution. We also devote a number of lessons to current issues such as electronic and virtual groups, high performance work teams and shared leadership in a team environment. The course is particularly relevant to professional development in that cadets gain a comprehensive understanding of the dynamics of small group and team interaction. This allows them to develop and implement creative leader actions that will maximize unit/team effectiveness.</p> <p><b>Lessons:</b> 40 @ 55 min (2.500 Att/wk)    <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> None</p> <p><b>Prerequisite(s):</b> PL100<br/>-Or-<br/>PL150<br/>-Or-<br/>PL100B</p> |                            | No Course Offerings                                                                                    |

| <p>This course surveys the field of contemporary social psychology. Cadets examine the impact of social structure and group membership on social behavior, while focusing on processes such as attribution, cognition, and learning that underlie social behavior. The course is intended to enable cadets to more effectively analyze and explain human behavior in a given situation. Specific topics include the self, attitudes and attitude change, conformity, obedience, compliance, deviance, helping behavior, aggression, attraction and romance, groups and intergroup relations, and collective behavior. The classroom experience is heavily discussion-oriented in order to maximize the applications of social psychological concepts, theories, and perspectives to daily life and military leadership.</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)    <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> None</p>                                                                                                                                                            |                            | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2027-9<br>2028-1 2028-2 2028-9<br>2029-1 2029-2 2029-8<br>2029-9 |

Sociological theory is a set of interrelated ideas that allow for the systemization of knowledge of the social world, the explanation of that world, and predictions about the future of the world. In some ways, all of us are amateur theorists, interpreting the meanings of the events and encounters that shape the world and ourselves. In PL384 cadets will learn in-depth how theories can help make sense of our times and to choose courses of action to realize our collective and individual dreams. In this course, theory is brought down-to-earth, to show how a sociological imagination (in other words, a theoretical consciousness that embraces self-awareness) is valuable to self and society. Questions like "Are families disintegrating?" "Why are some people discriminated against?" "What accounts for the crime rate?" "Are religion and economics compatible?" "Why is the sexual division of labor so persistent?" "Are wars inevitable?" can be addressed. Theories are thus tentative answers to the questions that preoccupy us as members of families, professions, communities, nations and, increasingly, as global citizens.

**Scope:** 2026-1

**Offerings:**

This course provides cadets with detailed practical knowledge and skills in the experimental analysis of cognition, behavior and human performance. Particular emphasis is placed on design of laboratory and field experiments, laboratory automation and instrumented data acquisition, computer data analysis, and on the distinction between observational versus experimental research. The course includes practical exercises in several content areas of experimental and engineering psychology.

**Scope:** 2026-1

**Offerings:**

This course provides cadets with an introduction to counseling fundamentals emphasizing the practical application of theories, principles, and techniques essential for military leadership. Through hands-on experiences, including video and audio recording exercises, cadets will develop critical counseling skills necessary for guiding, supporting, and motivating individuals and teams. The curriculum addresses personal, performance, career, and disciplinary counseling within the unique context of military service, preparing cadets to lead effectively in both academic and operational environments. Topics include the counseling process, basic and advanced communication skills, interpersonal relationship dynamics, goal setting, intervention strategies, crisis intervention, multicultural awareness, and assertiveness. Assessments include behavioral demonstrations of counseling competencies and written examinations, ensuring cadets are equipped to foster resilience, cohesion, and high performance as future Army leaders.

**Scope:** 2021-2

**Offerings:**

This course is an individually supervised research and study program. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty member. Activities vary by project, but the primary purpose is for the cadet to engage in independent study and produce a work of scholarship. With the approval of one of the Program Directors in the Department of Behavioral Sciences and Leadership, the cadet chooses a project of interest and is supervised by a faculty member. Cadets are expected to perform an average of 4 hours of work per week towards completion of the project, for a total of 80 hours of work.

| This course is an individually supervised research and study program. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty member. Activities vary by project, but the primary purpose is for the cadet to engage in independent study and produce a work of scholarship. With the approval of one of the Program Directors in the Department of Behavioral Sciences and Leadership, the cadet chooses a project of interest and is supervised by a faculty member. Cadets are expected to perform an average of 4 hours of work per week towards completion of the project, for a total of 80 hours of work.                                                                                                                                                                          |                                                                                                                                                                                                                                                               | 2029-1                                                        |

| This course is an individually supervised research and study program. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty member. Activities vary by project, but the primary purpose is for the cadet to engage in independent study and produce a work of scholarship. With the approval of one of the Program Directors in the Department of Behavioral Sciences and Leadership, the cadet chooses a project of interest and is supervised by a faculty member. Cadets are expected to perform an average of 4 hours of work per week towards completion of the project, for a total of 80 hours of work.                                                                                                                                                                          |                                                                                                                                                                                                                                                               | No Course Offerings                                           |

| This course introduces the cadet to the physiological and anatomical structures and processes that underlie human behavior with an emphasis on human performance. The course examines the structure of the nervous and endocrine systems, the mechanisms of seeing and hearing, movement, stress and arousal, learning, memory, biological causes of abnormal behavior, sleep, language, and the effects on performance of damage to neural structures. Cadets are introduced to the scientific examination of real-world bio-psychological problems in laboratory assignments in examining tissue, brains and eyes to provide three-dimensional realism to classroom instruction. This course provides the basis for competence in later engineering psychology electives. Biological Psychology is the "hardware" introduction to engineering psychology. |                                                                                                                                                                                                                                                               | 2026-1 2026-8 2027-1<br>2027-8 2028-1 2028-8<br>2029-1 2029-8 |

| This course covers the acquisition and analysis of information by the human nervous system from examination of the physical properties of light and sound, the functioning of the visual, auditory systems and the kinesthetic processes, and the theoretical background of contemporary perceptual research. The following general topics are covered: psychophysical methods, including measurement, scaling and signal detection theory; physiology of the visual, auditory and kinesthetic systems; recognition of color and brightness, pitch and loudness, patterns, features, and the role of visual channels; visual detection and tracking; the role of kinesthesia in military applications; and research methodology in perception. Laboratory assignments provide an opportunity to apply concepts learned to real-world challenges.            |                                                                                                                                                                                                                                                               | 2026-2 2027-2 2028-2<br>2029-2                                |

| This course addresses the processes of human information gathering, learning and memory using an information processing model. The course deals with cognitive theory and application, including stage models of processing and memory, machine models and artificial intelligence, and research methodology in these areas. Emphasis is placed on practical military applications in such areas as pattern recognition and detection, text processing, visual search and associated problems. Laboratory experiences stress development of experimental paradigms in this area of investigation and the use of test instrumentation, and computer software models to investigate cognitive processing.                                                                       |                                | 2026-2 2027-1 2027-2<br>2027-8 2028-1 2028-2<br>2028-8 2029-2 2029-8<br>2029-9 |

| Criminology is the scientific study of the making of laws, the breaking of laws, and the reaction to the breaking of laws. When a crime appears to have been committed and authorities have been notified, the criminal justice system is set in motion. The criminal justice system is the societal response to crime and includes three major activities: law enforcement, the judicial process, and corrections. The course provides an overview of (a) the theories offered to explain crime and delinquent behavior (b) the criminal justice system's responses to those behaviors, and (c) the relationships between the varied explanations of criminal behavior and society's response to those behaviors. The focus of the course is primarily on the United States. |                                | 2026-1 2027-1 2028-1<br>2029-1                                                 |

| Virtually every activity in which humans engage involves interacting with our environment, often in a physical manner. This course will teach cadets the fundamentals of anthropometrics and biomechanics so they can plan for and design for the physiological capabilities and limitations of humans. Anthropometrics is the study of human measurement. Biomechanics is the study of forces on our muscular and skeletal system. Using these disciplines, cadets will conduct bodily and workspace analyses to improve the environments, equipment, and systems with which humans interact. The course will emphasize work performed in military settings.                                                                                                                 |                                | 2026-2 2027-2 2028-2<br>2029-2                                                 |

| This course is devoted to exploring concepts and theories of leadership and leader development to enhance cadet understanding, implementation, and assessment of leadership practices at the individual, team, and organizational level. The course examines the evolution of leadership theory, emphasizes scientific research and empirical support for existing leadership theories, and produces critical and creative thinkers. Additionally, cadets will study emerging leadership perspectives and engage in case studies to enhance their understanding and application of effective leadership styles in the volatile, uncertain, chaotic, and ambiguous (VUCA) world.                                                                                               |                                | 2026-2 2027-2 2028-2<br>2029-1 2029-2 2029-8                                   |

The Department of Behavioral Sciences and Leadership's Academic Individual Advanced Development (AIAD) program is designed to give cadets practical experience in their field of study and to reflect on their experiences by completing specified academic requirements. Recent AIADs have involved internships with the American Psychological Association; studies of psychological support to NATO operations in France and stress in military operations in Norway; as well as other topics in CONUS, China, Germany, and Australia. Scope, depth and material covered will meet the requirement of a 3-credit hour course in the department. Grades are determined based on preparatory briefings and essays, a journal of daily activities or Weblog with instructors, the quality of the work performed during the internship, student evaluation of the experience and a final paper, briefing, or exam that incorporates their experience with a topic from their field of study, due upon return.

|--------------|----------------------------------|----------------------------------------------------------|

---

**Scope:**

2026-1

**Offerings:**

This advanced research methods course provides cadets with in-depth education in the principles and practices of scientific research in the behavioral sciences. Cadets will further develop their research skills and mastery of the scientific method, with a focus on designing, conducting, and interpreting complex research projects. Emphasis is placed on advanced research methodologies and data analysis techniques essential for evaluating evidence and solving real-world problems relevant to military leadership and operations. Through hands-on research experience, peer collaboration, and critical analysis of current literature, cadets develop the analytical and methodological expertise necessary to lead evidence-based initiatives that enhance unit effectiveness, inform military training, and advance our understanding of human performance in military contexts.

**Lessons:** 22 @ 75 min (2.000 Att/wk)

**Labs:** 8 @ 75 min

---

**Scope:** 2026-1 **Offerings:**

PL471 provides an interdisciplinary examination of leadership in combat at the tactical level. The course establishes a theoretical foundation for understanding the human dimension of combat and investigates the factors that influence effective leadership of soldiers in high-stress, dynamic environments. Cadets will engage with a diverse collection of readings, films, first-hand accounts from combat veterans, and guided self-study to critically analyze leadership challenges and strategies in combat situations. Emphasis is placed on developing insights and skills essential for leading soldiers under the unique pressures of military operations.

---

**Scope:** 2010-2 **Offerings:**

This course examines the individual, group and organizational level influences on human behavior in the international arena. Cadets will gain an understanding of these influences and use the insights gained to formulate leader actions to effectively motivate and manage in a global environment. The course emphasizes the practical application of management theories and research findings in the international situations that cadets encounter in their personal lives and in the field Army with an increasing emphasis on the global environment. Course content includes foundations of individual behavior, diversity, motivation, decision making, rewards, feedback and power and influence in an international setting. We will also examine organizational influences on ethical behavior in the global arena with an emphasis on creating ethical climates in the organizations we belong to.

|---------------|--------------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1 **Offerings:**

This course introduces cadets to concepts of studying the impact of connected technologies and data collection on society. It enhances lethality and warfighting capabilities by improving critical thinking and decision-making abilities, preparing cadets for the challenges they will face on the modern battlefield as technology continues to advance. The course supports the pillars of Academic, Physical, and Military development to prepare cadets for future leadership challenges. This approach is accomplished through synthesizing arguments in short, two-page papers, conducting peer reviews of other students' papers, and applying course readings to real-world examples through a variety of case study formats. A term-end exam is completed by the course's end. \*\*This is a pilot course and must receive CC review NLT AY27-2 to continue.\*\*

---

**PL475 HUMAN-COMPUTER INTERACTION**
**3.0 Credit Hours**  
**(BS=0.0,ET=1.0,MA=0.0)**

**Scope:** 2026-1

**Offerings:**

Computer use in the world today is at an all-time high. Consequently, the need for user-friendly computers is crucial. Somewhat ironically, human capacity for memory has often been explained using the computer metaphor, while the computer designer often attempts to instill human-like qualities into their computer designs. This course focuses on the interface between the human and computer. Initial focus is placed on understanding the theoretical foundations of human processes. The course then examines how these processes interact with computer usage. Students will learn design principles that enhance compatibility with computer systems.

---

**PL476 EDUCATIONAL PSYCHOLOGY**
**3.0 Credit Hours**  
**(BS=0.0,ET=0.0,MA=0.0)**

**Scope:** 1979-2

**Offerings:**

In this course, cadets will develop their instructional skills and formulate a conceptual basis for their instructional practices as army officers. The course is oriented toward the study of psychological theories of learning and application of these theories to the design, delivery, and evaluation of adult education and training. The course is subdivided into major areas of study. Learning theory focuses on the study of the learning process with balanced treatment given to behavioristic and cognitive perspectives. Instructional design emphasizes a systems approach to planning and decision making in learning situations.

No Course Offerings

**Lessons:** 40 @ 55 min (2.500 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Course practicum in which cadets design, deliver, and evaluate a learning experience. The practicum involves submission of a written design plan and evaluation (15-20 pages) and the delivery of instruction (55 minutes).

---

**PL479 LEADING CHANGING ORGANIZATIONS**
**3.0 Credit Hours**  
**(BS=0.0,ET=3.0,MA=0.0)**

**Scope:** 2026-1

**Offerings:**

This course explores the challenges and strategies of leading organizational change in dynamic environments shaped by technological innovation, evolving societal values, and complex global issues. Cadets will gain a foundational understanding of organizational functioning and empirical evaluation, then apply evidence-based approaches to design and assess improvement initiatives. Drawing from industrial/organizational psychology, behavioral science, business, management, and military doctrine, the course uses case studies, empirical analysis, and collaborative projects to examine real-world successes and failures. Cadets will develop practical leadership strategies for implementing and evaluating change, preparing them to drive transformation and adaptability as future Army leaders.

---

**PL482 ARMED FORCES AND SOCIETY**
**3.0 Credit Hours**  
**(BS=0.0,ET=0.0,MA=0.0)**

**Scope:** 2026-1

**Offerings:**

This course examines the intersection of armed forces and society, focusing on two key domains: the relationship between military organizations and the broader societal context, and the study of the military as a distinct social institution with unique demands on its members. Grounded in a military sociological perspective, cadets will analyze the military's role within society and culture in the United States and internationally. The course emphasizes critical reading, writing, and discussion of contemporary military and societal issues, and challenges cadets to apply their understanding to address real-world problems. Cadets will integrate course concepts into a focused research project that explores an aspect of the human dimension of the armed forces and society.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Research paper that applies course concepts to analysis of the current military.

**Prerequisite(s):** PL300  
-Or-  
PL350

| <b>PL485</b> | <b>HUMAN FACTORS ENGINEERING</b> | <b>3.0 Credit Hours</b><br><b>(BS=0.5,ET=1.5,MA=0.0)</b> |
|--------------|----------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

This course surveys the theories and methods of human factors engineering (ergonomics). Human factors engineering is concerned with the application of technology and the design of equipment for human use. This course emphasizes the cognitive dimension of human factors engineering. The focus is on understanding the capabilities and limitations of humans as they interact with equipment and facilities. This course lays the foundations for the systematic application of information about humans to the design of equipment and workspace environments.

**Lessons:** 24 @ 75 min (2.000 Att/wk)      **Labs:** 6 @ 75 min

**Special Requirements:** Term project--research report and oral presentation. Students will perform an in-depth analysis of an existing human-machine system. Results will be reported in written and oral formats.

| <b>PL488B</b> | <b>CAPSTONE SEM IN BEHAVIORAL SCI</b> | <b>3.0 Credit Hours</b><br><b>(BS=0.0,ET=0.0,MA=0.0)</b> |
|---------------|---------------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

This capstone seminar engages cadets in advanced study of behavioral science topics through small group discussions and problem-based learning projects. Focusing on applied psychology, organizational psychology, leadership, and the intersection of military and society, the course addresses issues and challenges relevant to the Army and West Point. Cadets collaborate on real-world projects that require critical analysis and practical application of behavioral science principles, preparing them for leadership roles as Army officers. Course topics are dynamic and revised annually to reflect emerging issues and priorities within the military context.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Limited to Behavioral Sciences Majors in their Firstie year.

| <b>PL488C</b> | <b>COLLOQUIUM-BSL-LEADERSHIP</b> | <b>3.0 Credit Hours</b><br><b>(BS=0.0,ET=0.0,MA=0.0)</b> |
|---------------|----------------------------------|----------------------------------------------------------|

---

**Scope:** 1984-1

**Offerings:**

The colloquium focuses on advanced study of behavioral science topics and issues using small group discussions of important books and articles of both traditional and contemporary topics in psychology, sociology, organizational leadership, and engineering psychology. It is a reading and discussion course. Subcourse topics are not fixed and are subject to annual revision.

**Lessons:** 40 @ 55 min (0.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Two to four critical essays and oral presentations based on readings.

**Scope:** 2021-2

**Offerings:**

This course is an individually supervised research and study program. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty member. Activities vary by project, but the primary purpose is for the cadet to engage in independent study and produce a work of scholarship. With the approval of one of the Program Directors in the Department of Behavioral Sciences and Leadership, the cadet chooses a project of interest and is supervised by a faculty member. Cadets are expected to perform an average of 6 hours of work per week towards completion of the project, for a total of 120 hours of work.

| This course integrates the material previously covered in the Human Factors curriculum, especially PL485, Human Factors Engineering. It uses the theoretical bases and practical applications of Human Factors Engineering in the treatment of design problems. Emphasis in this course is on the design of systems to fit human capabilities. Course project is a design project of a contemporary applied problem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                               | 2026-2 2027-2 2028-2<br>2029-2                     |

| The course provides cadets with an opportunity to enhance their skills in one or a combination of the disciplines hosted in the Department of Behavioral Sciences & Leadership. Under the supervision of a faculty advisor, each cadet defines a topic, conducts a review of the literature, and develops a research plan. Regular meetings with faculty advisors are scheduled to discuss issues in methodology, review progress in the review of the literature, and critique draft papers. At the end of the semester, cadets present a fully developed research proposal for their thesis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                               | 2026-1 2027-1 2028-1<br>2029-1                     |

| This course continues the work on the thesis completed in PL497. Under the supervision of a faculty advisor, each cadet executes the proposed thesis plan, submits a written thesis, and presents their project during Projects Day and/or at a professional conference. Regular meetings with faculty advisors are scheduled to discuss issues in methodology, complete data analyses, and critique draft papers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                               | 2026-2 2027-2 2028-2<br>2029-2                     |

| This course is designed to enhance cadets' leadership performance through the application of essential leadership skills in challenging, on-going, real-world projects, and scenario-driven leadership laboratory exercises. The course uses a series of "concept study > actions > reflections" (CAR) cycles to focus students on the enhancing (and hindering) factors that typically surface when an individual has responsibility for executing a project and must "do" leadership. Cadets move through a CAR cycle in three related stages. First, cadets consider specific concepts, theories and models of leadership covered in prior courses. Then, using a pool of projects resourced by the faculty expressly for this course, cadets wrestle with real-world leadership projects (such as leading an organizational unit through an unexpected change), keeping these issues and insights in mind. Finally, both during and after the project, cadets engage in self-reflection exercises (e.g., journals) and meet with faculty mentors, to help process and make sense of their leadership experience on both a personal and conceptual level. |                                                                                                                                                                                                                                                               | No Course Offerings                                |

| New Cadets negotiate a demanding training regimen in soldiering and cadetship. The New Cadet makes the transition into the Corps of Cadets and learns the standards of behavior and values consistent with the mission of the United States Military Academy. The New Cadet is evaluated by the cadet chain of command and summer Tactical Officer during each of two details and receives a grade for MD100, which is a numerically weighted average of the submitted grades.                                                                                                                                              |                                   | 2027-0 2028-0 2029-0                                          |

| Fourth Class cadets learn to be a follower and to support the chain of command and to develop understanding of and commitment to the duty concept. Fourth Class cadets serve as members of a squad in their assigned companies. The Fourth Class cadet's primary task is to strive for individual excellence in academic, military, and physical activities while developing teamwork among their classmates. The Fourth Class cadet is evaluated by the cadet chain of command and company Tactical Officer and receives a grade for MD101, which is a numerically weighted average of the submitted grades.               |                                   | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| Fourth Class cadets learn to be a follower and to support the chain of command and to develop understanding of and commitment to the duty concept. Fourth Class cadets serve as members of a squad in their assigned companies. The Fourth Class cadet's primary task is to strive for increased individual excellence in academic, military, and physical activities while optimizing the teamwork among their classmates. The Fourth Class cadet is evaluated by the cadet chain of command and company Tactical Officer and receives a grade for MD102, which is a numerically weighted average of the submitted grades. |                                   | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| Third Class cadets participate in a demanding training program which further develops proficiency in Pre-Commissioning Tasks and exposes the Third Class cadet to tactical tasks that require teamwork. Various training situations provide opportunities for Third Class cadets to serve as leaders where they are observed by the cadet chain of command and officers. The Third Class cadet is evaluated by the cadet chain of command and summer Tactical Officer during each of two details and receives a grade for MD200, which is a numerically weighted average of the submitted grades.                           |                                   | 2027-0 2028-0 2029-0                                          |

Third Class cadets serve as team leaders. They learn to lead others by exercising responsibility for the professional development of one or two subordinates, while serving as a member of a larger military unit. Drawing on recent experiences as Fourth Class cadets, Third Class cadets offer expertise and counsel which facilitates the transition process and development of cadet privates. The Third Class cadet is evaluated by the cadet chain of command and company Tactical Officers and receives a grade for MD201, which is a numerically weighted average of the submitted grades.

**Scope:** 2014-0

**Offerings:**

First and Second Class cadets will serve as members of the cadet Chain of Command for a West Point Leader Detail. First Class cadets, as Senior NCOs or officers, learn the basic duties and responsibilities of a commissioned officer by leading in a cadet summer training assignment. They set the example for all subordinates by establishing and attaining sound goals, maintaining standards of behavior, and demonstrating values within the organization. They develop subordinates in such a fashion as to foster teamwork, cohesion, and the desire to excel in all areas of endeavor. Second Class cadets serve as cadet noncommissioned officers. This affords them the opportunity to learn and experience the roles and functions of non-commissioned officers in military units while training and leading their subordinates in both individual and collective training. First and Second Class cadets are evaluated by the cadet chain of command and company Tactical Officer and receive a grade for MD300, which is a numerically weighted average of the submitted grades.

| First and second class cadets learn the basic duties and responsibilities of a commissioned and noncommissioned officer by leading in an active Army unit during CTLT. CTLT provides first and second class cadets with a realistic leadership environment to observe, while performing duties normally given newly assigned second lieutenants in the active Army. In CTLT, the cadet is evaluated by the officer chain of command in his/her unit and receives a MD400 grade of Pass/Fail.                                                                                                                           |                                      | 2027-0 2028-0 2029-0                                                 |

| First Class cadets serve in First Sergeant, Command Sergeant Major or officer leadership positions from platoon through brigade level and learn to lead through their personal influence upon both a chain of command and staff. They learn that success as a leader is based on the performance of the unit and demonstrate their capacity to exercise personal self-discipline in the absence of close supervision. The First Class cadet is evaluated by the cadet chain of command and company Tactical Officer and receives a grade for MD401, which is a numerically weighted average of the submitted grades.   |                                      | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2        |

| MD403 is for First Class cadets who fail MD402 and are therefore placed in a conditioned status at the end of their First Class year. First Class cadets enrolled in MD403 will serve two consecutive details in either Cadet Basic Training or Cadet Field Training. The requirements outlined for MD300 apply to MD403; evaluation is conducted in the same fashion. The grades from each detail are each equally weighted and combined to derive an overall MD403 grade.                                                                                                                                            |                                      | 2026-1 2027-0 2027-1<br>2028-0 2028-1 2029-0<br>2029-1               |

| MD404 is offered to cadets who remain at the Academy beyond eight semesters and have participated in all previous military development courses. Cadet officers in MD404 will receive a grade based on performance and requirements specified in MD402. Evaluation is conducted in the same fashion as in MD402.                                                                                                                                                                                                                                                                                                        |                                      | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2        |

| <p>This course is designed to improve cadet academic performance and mental agility. Mastery of a variety of these strategies leads to development of a more self-regulated leader of character. Strategies presented include: help seeking (AI, Library, tutors), organization and time management, class preparation (text study system), test preparation, overcoming nerves, learned optimism and importance of attitude. The strategies mastered are implemented immediately into the cadets' present life at USMA and contribute to life-long learning. The course has no graded assignments. A final pass/fail grade determination is recorded on the cadet transcript.</p> |                                          | 2026-1 2027-1 2028-1<br>2029-1                                |

| <p>This course develops flexible reading strategies. Increasing one's base reading rate while maintaining comprehension is accomplished through the use of computer programs, textbook reading, and recreational reading. Various pacing techniques and supervised practice lead to the increase of both reading rate and comprehension, but most of all to the development of a reader who has a variety of strategies to use depending upon the type of reading required.</p>                                                                                                                                                                                                    |                                          | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| <p>This course is designed to improve cadet information literacy and critical thinking performance at USMA. Mastery of a variety of strategies leads to this goal. Strategies presented include: effective thinking, goal setting, time management, understanding of the research process, academic/library research skills, evaluation of information sources, critical reading and reasoning. The strategies mastered are implemented immediately into the cadets' present life at USMA and contribute to life-long learning. The course has no graded assignments. A final pass/no-credit grade determination is recorded on the cadet transcript.</p>                          |                                          | 2026-2 2027-1 2027-2<br>2028-1 2028-2 2029-1<br>2029-2        |

---

**Scope:** 2020-2**Offerings:**

This course introduces cadets to the essential principles and skills of performance psychology and provides a framework through which these principles can be applied toward the pursuit of academic, athletic, and military excellence. The continuous cycle of conscious thought processes leading to unconscious mood states affecting physiological change and thus performance execution is examined in the context of each student's own experience of successful performance, and then specific skills which optimally leverage the mind-body connection are taught and practiced. Cognitive skills for confidence development, attention control methods, relaxation techniques, and imagery are taught and practiced. A detailed personal goal setting plan is completed by the course's end.

| <p>This course provides a solid background in chemistry principles and applications. It includes a study of the nature of matter, its atomic and molecular structure, and associated energies. Fundamental concepts, principles, theories, and laws of chemistry are emphasized. Stoichiometry, states of matter, solutions, foundational thermodynamics, acid-base and redox reactions are addressed. The course also provides the student with an introduction to materials chemistry, environmental chemistry, and military chemistry. An extensive laboratory program is integrated within the course and is designed to develop an appreciation of classical and modern investigative techniques and to reinforce fundamental concepts introduced in the classroom.</p>                                                                           |                           | 2026-1 2026-2 2026-5<br>2027-1 2027-2 2027-5<br>2027-9 2028-1 2028-2<br>2028-5 2028-9 2029-1<br>2029-2 |

| <p>USED FOR SCHEDULING PURPOSES ONLY. This course provides a solid background in chemistry principles and applications. It includes a study of the nature of matter, its atomic and molecular structure, and the associated energies involved. Fundamental concepts, principles, theories, and laws of chemistry are stressed. Stoichiometry, states of matter, solutions, kinetics, thermodynamics, acid-base and redox equilibria, electro-, organic, and nuclear chemistry are stressed. The course also provides the student with a strong foundation in materials chemistry, the chemistry of life, environmental chemistry, and military chemistry. A laboratory program is integrated within the course and is designed to develop an appreciation of classical and modern investigative techniques and to illustrate fundamental concepts.</p> |                           | No Course Offerings                                                                                    |

| <p>This course extends the foundational disciplinary content and practices from General Chemistry I into chemical equilibrium acid/base chemistry, electrochemistry, thermodynamics (entropy and free energy) and kinetics. Basic principles governing organic chemistry is also addressed. The laboratory is integrated within the course. The initial labs develop skills which are they applied to an authentic research problem.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |                           | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2                                          |

**Scope:** 2026-1

**Offerings:**

USED FOR SCHEDULING PURPOSES ONLY. This course provides a solid background in chemistry principles and applications. It includes a study of the nature of matter, its atomic and molecular structure, and the associated energies involved. Fundamental concepts, principles, theories, and laws of chemistry are stressed. Stoichiometry, states of matter, solutions, kinetics, thermodynamics, acid-base and redox equilibria, electro-, organic, and nuclear chemistry are stressed. The course also provides the student with a strong foundation in materials chemistry, the chemistry of life, environmental chemistry, and military chemistry. A laboratory program is integrated within the course and is designed to develop an appreciation of classical and modern investigative techniques and to illustrate fundamental concepts.

| This course provides a broad understanding of biological principles, applications and the relevance of biological science to the military and society. This course consists of an examination of the unity and diversity of life. The course utilizes a reductionist approach to biological study by beginning with an introduction to life at the cellular level and proceeding through Mendelian Genetics, central dogma, DNA technologies, and Darwinian evolution. The course culminates in the application of basic biological principles to human structure and function. Emphasis is placed on course material that is relevant to current environmental issues and disease particularly as these areas apply to military operations. A laboratory program is integrated within the course and is designed to enhance understanding of classical and modern investigative techniques and to illustrate fundamental concepts. |                                                                                                                                                                                                    | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2027-8<br>2028-1 2028-2 2028-8<br>2029-1 2029-2 |

| Introduces the methods of research in chemistry, chemical engineering, or life science that includes use of the research literature and instruction in intermediate experimental and theoretical procedures and techniques specific to the cadet's program of study. Under the direct supervision of faculty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                    | 2026-1 2026-2 2026-7<br>2027-1 2027-2 2028-1<br>2028-2 2029-1 2029-2                  |

| Healthcare is a complex and rewarding field with numerous career opportunities for military service members. This course is intended for cadets planning to attend medical school and/or seriously interested in a healthcare career. The course will examine important aspects of medicine that transcend the basic sciences including medical history, economics, ethics, and challenges to healthcare in the United States. An introduction to military medicine will be provided with information on deployments, career opportunities, and changes in military healthcare. Coverage of these important topics will provide exposure to key issues and help cadets prepare for futures as medical professionals. |                                                                                                                                                                                                    | 2026-1 2027-1 2028-1<br>2029-1                                |

| Healthcare is a complex and rewarding field with numerous career opportunities for military service members. This follow-on course is intended for 2nd class cadets planning to attend medical school. Course content will focus on the medical application process and topics of interest to future physicians. Specific subjects will include writing a personal statement, interviewing, selecting a medical school, completing the AMCAS application, and the basics of clinical practice. The seminar will facilitate the development of knowledge and skills key to the medical school application process while providing an opportunity to monitor MCAT preparation.                                         |                                                                                                                                                                                                    | 2026-2 2027-2 2028-2<br>2029-2                                |

**Scope:** 2026-1

**Offerings:**

This course is designed to develop an understanding of the field of biomedical engineering. The course covers application of engineering principles to the study of medical physiology. Topics include biomaterials and biomaterial processing, interaction of biomaterials with tissues, tissue engineering, transport modeling, and medical imaging. Mathematical modeling is an integral part of the course.

|--------------|-------------------------------|----------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

This course is designed to develop an understanding of the field of biochemical engineering. The course covers the application of engineering principles to the study of bioprocesses and biochemical reactor design. Topics include enzymes and enzyme kinetics, cell growth and cell growth kinetics, suspension and immobilization of cultures, bioreactor design, scale-up, and control, and recovery and purification technology. Mathematical modeling is an integral part of the course.

|--------------|-----------------------------------|---------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

Introduction to mass and energy balances in single phase and multiphase, nonreactive and reactive systems. Course topics include an introduction to engineering calculations and process variables, use of computers in solving chemical engineering problems, fundamentals of material balances in single-phase and multi-phase systems, energy balances on nonreactive and reactive processes, applications of combined material and energy balances, introduction to chemical engineering unit operations, and a general introduction to the field of chemical engineering.

**Scope:** 2026-1

**Offerings:**

This course covers methods for the physical separation of chemicals. Topics include dew point and bubble point calculations, adiabatic flash, distillation, chromatography, liquid-liquid and gas-liquid absorption. Students are taught the significance of staging of unit operations. Heavy emphasis is placed on theory of operation, numerical methods of solution, and simulation.

---

**Scope:** 2026-1

**Offerings:**

This course studies the effects of chemical reaction kinetics on systems of engineering significance. It introduces selection and operation of commercial chemical reactors, emphasizing chemical kinetics and transport phenomena. It studies currently practiced engineering techniques associated with each of these reactors. Topics covered in this course include ideal reactors including batch, CSTR and PFR, isothermal and nonisothermal. Other topics may include catalytic reactors, bioreactors, reactors, transient and steady state design, pressure drop in reactors, recycle, stability, and numerical methods.

---

**Scope:** 2026-1

**Offerings:**

This course covers the body of thermodynamic knowledge necessary for understanding modern chemical process simulation. Students learn the theory behind the thermodynamic methods used in the software. The course includes calculus- and numerical-based thermodynamics approaches for determining the properties of substances, solutions, and multiphase mixtures. Topics include equations of state, pure component properties, transport properties, properties of mixtures, fugacity, excess properties, activity coefficients, and phase equilibria. The problems in the course emphasize engineering applications. Topics covered in class are related to real systems through the use of chemical process simulators.

**Scope:** 2026-1

**Offerings:**

This course covers the principles necessary to understand the automatic control of chemical processes. Students learn the current mathematical models and mechanical details of various control elements, including sensors, transmitters, actuators, and controllers. Application of mathematical models will be covered with dynamic modeling techniques as well as real-time training using process simulators. The course will also cover tuning of controllers as well as safe response to process upsets. A capstone project will involve dynamic modelling of an integrated process control system.

| <p>The course teaches the fundamental concepts of analytical chemistry. Topics include acid-base equilibria, redox potentials, compleximetric titrimetry, separations, electrochemistry, and absorption spectroscopy. The course provides an overview of modern analytical techniques being used in various fields. The course emphasizes the development of rigorous laboratory techniques and introduces the cadet to computer based data acquisition. Cadet laboratory work is evaluated in terms of the student's ability to accurately determine the identity and quantity of an unknown sample.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                               |                                              |

| <p>This course focuses on the evolution, diversity, structure, and processes of living organisms. The curriculum starts with a description of the structure and function of cells and their metabolism. These topics are used to explain DNA replication, transcription, translation and gene expression. In turn these concepts serve as a foundation of knowledge examining natural selection, population genetics, biodiversity, and ecology. Emphasis is placed on related course material to current environmental issues and disease, particularly as these areas apply to military operations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                               |                                              |

| <p>This course provides a deep understanding of the wide variety of advanced techniques of light microscopy used universally to investigate living and fixed systems at the cellular and molecular level. This course consists of an examination of optical-based microscopy techniques based on light's behavior as a ray, as a wave, and as a particle. Microscopy techniques below the diffraction limit of light and ethics in image analysis are also studied. This course uses both theoretical and hands-on methods to develop a deeper understanding of the fundamental properties underlying the use of microscopy as a tool for the study of the amazingly diverse world too small for humans to see with the unaided eye. The course culminates in the use of laser scanning techniques to probe the microscopic world below the Abbe diffraction limit of light which was once believed to be impossible with light microscopy. Emphasis is placed on advanced microscopy concepts, equipment, problems and traditional microscopy challenges particularly as these areas apply to challenges facing military and civilian researchers in the world today.</p> |                               |                                              |

| Organic chemistry I is an introduction to the relationship between chemical structure and the physical and chemical properties of molecules. A qualitative description of structure and bonding is presented. The relationships between free energy changes and equilibria, and between activation energy and rate of reaction are developed. Stereochemistry and isomerism are explored. The concept of the mechanism of reaction is presented and the relationships between mechanism, the least energy path, stable intermediates and transition states are exemplified by the reactions of the alkanes, alkenes, alkyl halides, and alcohols. The use of instrumental methods of structural analysis is also introduced. |                                     | 2026-1 2026-8 2027-1<br>2028-1 2029-1             |

| The reactions of the important functional groups are explored: conjugated alkenes; aldehydes; ketones; carboxylic acids; and amines. The concept of aromaticity is explored and its mechanistic implications are developed. Selected topics in carbohydrate and lipid chemistry are also studied. Functional group interconversions and synthetic strategy are presented. The laboratory capstone synthesis introduces cadets to multi-step synthetic sequences.                                                                                                                                                                                                                                                             |                                     | 2026-2 2027-2 2028-2<br>2029-2                    |

| The course will cover the structure and function of prokaryotic and eukaryotic cells. The course will present a detailed discussion on the molecular biology of DNA replication, transcription, translation, the control of gene expression, cell-to-cell signaling, and the cytoskeleton. Emphasis will be placed on research methods and techniques that have lead to our understanding of how the cell works.                                                                                                                                                                                                                                                                                                             |                                     | 2026-1 2027-1 2027-8<br>2028-1 2028-8 2029-1      |

| This course consists of an in-depth study of human physiology and the interrelationships between major organs and systems of the body. This course will concentrate on homeostatic reflex mechanisms of the human body. Major topics covered include endocrinology, neural physiology, muscles, cardiovascular physiology, respiratory physiology, renal physiology, digestion, immunology, and reproductive physiology. The laboratory program reinforces the foundational principles of thermoregulation, muscle, cardiac, respiratory, neural, sensory and renal physiology and introduces cadets to basic laboratory measurements and diagnostics for each of those subjects.                                            |                                     | 2026-2 2026-8 2027-2<br>2028-2 2029-2             |

Genetic analysis has transformed the ability to investigate organisms from single genes to complete genomes. This course examines the structure and function relationships of inheritance and genetic variation while introducing fundamental methodologies for the modern analysis of genes and genomes. Students will learn the fundamental principles of molecular genetics, heredity and genetic diseases, high throughput sequencing, and quantitative genetics. It is expected that students will enter with a basic understanding of the characteristics of life, and the nature of DNA & RNA organization, replication, and transcription. Students will develop problem-solving skills to extract and utilize genetic information for use in scientific research and medicine while considering the bioethics of this rapidly evolving field.

2026-2 2027-2 2028-2  
2029-2

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** All cadets will complete a Mendelian Project.

**Corequisite(s):** CH375

**Scope:** 2026-1

**Offerings:**

This course provides a capstone experience that brings together material from previous courses to examine contemporary problems in chemical engineering process design. The course provides instruction in the conceptual design of processes to achieve design goals, as well as the economic optimization of the process. The course emphasizes the use of computer simulations, theory of unit operations, process control, safety, environmental and economic factors. The effect of changes in design on the process economics will be investigated. Written design reports for the capstone design project are required.

---

**Scope:** 2026-1

**Offerings:**

This course provides a broad understanding of bioengineering disciplines to include biomechanics, biomaterials, tissue engineering, biocatalysis, biochemical engineering, and biosensors. Fundamental concepts of molecular kinetics, thermodynamics, and mass transport are applied in problem sets in each bioengineering sub-discipline and capstone design project providing students the opportunity for modeling, analysis, and design from the biomolecular to physiological length scale and across multiple time scales. Modeling software such as MATLAB and Mathematica is extensively used.

| <p>This course introduces the diversity of microorganisms in all three domains of life. The course covers prokaryotic cell structure and function, growth, genetics, and metabolism. The course will survey five major groups of microorganisms: eubacteria, archaea, protozoa, fungi and viruses including ecology, their role in human disease and their applications in medicine, industry and warfare. Cadets have the opportunity to explore both a viral and a bacterial disease in-depth and present their findings in a briefing and a paper. The 18-hour laboratory program focuses on practical applications of concepts covered in class, with a particular emphasis on the eubacteria. The lab program culminates with a hands-on laboratory examination.</p> |                          | 2026-1 2027-1 2028-1<br>2029-1 |

| This course is designed to provide cadets with a detailed study of the anatomical structure of the human body. Body structure will be studied by organ systems and will involve a balance between gross anatomical study and histology. Form-function relationships will be emphasized. The laboratory study will involve working with human skeletal collections and virtual dissection of cadavers and preserved specimens. The 14-hour laboratory program focuses on structural identification (naming) of human and mammalian anatomy and various imaging modalities (e.g., radiographs, CT scans), and computer programs. Cadets that successfully complete this course will have a good understanding of human body structure, construction, and function. |        | 2026-2 2027-2 2028-2<br>2029-2 |

| This course is an introduction to modern polymer chemistry. It provides an introduction to macromolecules and their properties. It covers polymerization methods, copolymerization, the morphology of polymers, and the testing and characterization of polymer products. The course also introduces polymer additives, natural and biomedical polymers and modern polymer applications, emphasizing the military uses of polymer products. |        | 2026-2 2027-2 2028-2<br>2029-2 |

| This course features an in-depth study of main group and transition elements and their compounds, with emphasis on chemical bonding and both atomic and molecular structures. The fundamentals of quantum chemistry to include the valence bond and molecular orbital theories as applied to inorganic chemistry are studied. An introduction to symmetry/group theory, coordination chemistry/crystal field theory, chemistry in aqueous and nonaqueous solutions, and organometallic compounds are also included in the course. Chemical principles and spectroscopic techniques will also be emphasized. Journal articles from the chemical literature are used to supplement the text with topics of current interest. |        | 2026-1 2027-1 2028-1<br>2029-1 |

|---------------|--------|-------------------|

This course is an introduction to biochemical systems and concentrates on studying them from the molecular approach. Three themes are emphasized: 1) Structure - Function relationships, 2) Metabolism, and 3) Regulation of the systems and processes studied. The fundamental goals of the course are to provide students the basic knowledge of biochemistry and to give them a framework for analyzing problems and questions in life science studies. Additional emphasis is placed on familiarizing students with the experimental techniques used in biochemistry and their application to current issues of interest.

**Scope:** 2026-1

**Offerings:**

A laboratory course designed to develop proficiency in the selection and use of modern instrumental methods of chemical analysis. Topics include atomic spectroscopy, molecular absorption and fluorescence spectroscopy, infrared and Raman spectroscopy, nuclear magnetic resonance and mass spectrometry, and chromatography. The laboratory program includes a Capstone experimental procedure and methodology design component. Cadet laboratory work is evaluated in terms of the student's ability to determine the proper instrumental methodology to analyze a chemical sample.

**Scope:** 2026-1

**Offerings:**

This course is intended to reinforce topics learned in other life science courses by studying laboratory and practical applications of biotechnology. Laboratories will concentrate on biotechnology methods including purification, separation, and identification of DNA, RNA and protein. Other biotechnology techniques that will be studied include recombinant DNA techniques, PCR, and DNA sequencing. Classroom lessons will include discussions of assigned readings on the modern applications of biotechnology.

**Scope:** 2026-1

**Offerings:**

The major areas of study in this course are chemical thermodynamics with a special focus on chemical equilibrium, and chemical kinetics, introduction to intermolecular interactions. Some of the specific topics covered include properties of real gases, the kinetic theory of gases, the laws of thermodynamics as related to chemical systems, diffusion as a description of mass transport, rates of chemical reactions, and molecular reaction dynamics. The laboratory program illustrates the fundamental topics covered through precision measurements, utilizing modern instrumental and computational methods.

**Scope:** 2026-1

**Offerings:**

This course builds on the concepts covered in CH481 through a study of the quantum mechanics of atoms and molecules, their interaction with radiation, and statistical thermodynamics. Some of the specific topics covered include the electronic structure of atoms and molecules, molecular geometry, molecular symmetry, several types of spectroscopy used for identification and monitoring of the local molecular environment, and the details of molecular motion. Various levels of theory are used to obtain increasingly more accurate descriptions of atomic and molecular systems with user-friendly software tools. Statistical thermodynamics enables understanding about the connection between the microscopic details in quantum mechanics and the macroscopic observations made in the laboratory. The laboratory program illustrates the fundamental topics through use of modern instrumental and computational methods.

**Offerings:**

This course includes the study of the mechanisms of energy and mass transport, with special emphasis on applications in engineering systems. Coverage includes Fourier's Law of Heat Conduction, and Fick's Law of Diffusion, the development of shell energy and species balances, and the use of these equations to solve for temperature and concentration profiles in chemical engineering systems. An important emphasis in the course is the use of transport equations to understand species diffusion, convection, and chemical reaction in equipment design.

| <b>CH487</b> | <b>ADVANCED CHEMISTRY LABORATORY</b> | <b>3.0 Credit Hours</b><br><b>(BS=3.0,ET=0.0,MA=0.0)</b> |
|--------------|--------------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

In this laboratory course cadets will further develop their knowledge and understanding of organic and inorganic syntheses, quantitative and qualitative instrumental analysis, and applications of physical chemistry principles to molecular structure and kinetics. They will carry out experiments based on current needs and applications of the Army. Cadets and faculty will also discuss current research and present their work.

2026-2 2027-2 2028-2  
2029-2

**Lessons:** 5 @ 55 min (2.500 Att/wk)    **Labs:** 35 @ 120 min

**Special Requirements:** Library research and written reports are required. All cadets will complete an integrative experience group project that will investigate the social, political and economical implications of chemistry.

**Prerequisite(s):** CH474

|--------------|------------------------------|----------------------------------------------------------|

---

**Scope:** 2025-7

**Offerings:**

This undergraduate research course is designed to significantly advance the cadet's knowledge and comprehension of science and/or engineering by answering a real world scientific question. Course work includes defining a problem, understanding related issues, designing an experimental approach, analyzing data, and drawing conclusions. By applying the scientific method to attempt to solve an actual problem, cadets will expand their critical thinking and intellectual capability. Cadets are supervised by a faculty advisor with expertise in the chosen research area. Cadets conduct research individually but may be part of a larger group working on a project with a broad scope. The minimum requirement for moving onto CH490 is a defined problem and hypothesis, a background in related research, and an experimental design. The Head of the Department will approve cadet projects. Lessons and labs will be established through consultation between cadet and advisor. Requirements include both written and oral progress reports.

2026-1 2026-2 2026-7  
2027-1 2027-2 2028-1  
2028-2 2029-1 2029-2

**Lessons:** 0 @ 0 min (0.000 Att/wk)

**Labs:** 0 @ 0 min

**Special Requirements:**

LESSONS and LABS: Established by consultation between the cadet and his/her faculty advisor. Cadets are expected to perform an average of 120 hours per semester towards completion of the project.

**Prerequisite(s):**

CH102  
-Or-  
CH152

**CH489A**

**IND RESEARCH I**

**3.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:**

2026-1

**Offerings:**

2026-1

Same scope as CH489, but a continuation of research.

**Lessons:** 0 @ 0 min (0.000 Att/wk)

**Labs:** 0 @ 0 min

**Special Requirements:**

LESSONS and LABS: Established by consultation between the cadet and his/her faculty advisor. Cadets are expected to perform an average of 120 hours per semester towards completion of the project.

**Corequisite(s):**

CH489

**CH490**

**INDIVIDUAL RESEARCH II**

**3.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:**

2025-7

**Offerings:**

2026-1 2026-2 2027-1  
2027-2 2028-1 2028-2  
2029-1 2029-2

With the same outcome goal as CH489 of significantly advancing the cadet's knowledge and comprehension of science and engineering into answering a real world scientific question, this course typically involves experimentation, data analysis, data evaluation, and publishing results. Cadets are supervised by a faculty advisor with expertise in the chosen research area. Cadets conduct research individually but may be part of a larger group working on a project with a broad scope. This course could conclude in a poster presentation, publication and/or a conference presentation as the undergraduate researcher contributes to the larger scientific community. Requirements include both a written final report and an oral presentation.

| <p>The Advanced Individual Study provides cadets the unique opportunity to complete a carefully defined question or problem researched over the course of the previous 1.5 to 2 years. Based in research, this problem may be critical, experimental, applied, or creative in nature, and represents an effort to make an original contribution to the field. The Research Thesis is a culmination of a research effort that goes beyond normal requirements of the major and represents the cadet's best work in their discipline. Each thesis must demonstrate clear critical thinking, a mastery of disciplinary material, clarity in communication of complex ideas, and professionalism in production. Cadets must complete a written thesis and present an oral thesis defense to the faculty and staff. Additionally cadets having completed a year of research on one topic would be able to explore another researcher topic altogether. Written recommendation from Department Head must be presented to AARS and approved by the Dean of the Academic Board.</p> |                                                                                                                                                                                                                                                            | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| <p>The Advanced Individual Study provides cadets the unique opportunity to complete a carefully defined question or problem researched over the course of the previous 1.5 to 2 years. Based in research, this problem may be critical, experimental, applied, or creative in nature, and represents an effort to make an original contribution to the field. The Research Thesis is a culmination of a research effort that goes beyond normal requirements of the major and represents the cadet's best work in their discipline. Each thesis must demonstrate clear critical thinking, a mastery of disciplinary material, clarity in communication of complex ideas, and professionalism in production. Cadets must complete a written thesis and present an oral thesis defense to the faculty and staff. Additionally cadets having completed a year of research on one topic would be able to explore another researcher topic altogether. Written recommendation from Department Head must be presented to AARS and approved by the Dean of the Academic Board.</p> |                                                                                                                                                                                                                                                            | 2027-1 2028-1 2029-1                                          |

The cadet pursues advanced study of topics in preparation for the Medical College Admissions Test (MCAT) and the medical school application process on an individual or small group basis, independent of a formal classroom setting. MCAT preparation includes the following areas: Biological and Biochemical Foundations of Living Systems, Chemical and Physical Foundations of Biological Systems, Psychological, Social, and Biological Foundations of Behavior, and Critical Analysis and Reasoning Skills. Primary and secondary medical school applications are completed during this period. Like graduate level study and preparation for professional examinations, the scope of work is tailored to the interests and abilities of the cadet in consultation with a faculty advisor.

2026-3 2027-3 2028-3  
2029-3

**Lessons:** 0 @ 0 min (0.000 Att/wk)

**Labs:** 0 @ 0 min

**Special Requirements:**

Selection by Medical Program Advisory Committee (MPAC) to attend medical school directly from West Point.

**CH499**

**TOPICS IN CHEM/LS/CHMENG W/LAB**

**3.5 Credit Hours**  
**(BS=0.0,ET=0.0,MA=0.0)**

**Scope:**

2026-1

**Offerings:**

This course provides in-depth study of a special topic in chemistry, chemical engineering and life science not offered elsewhere in the USMA curriculum. Course content will be based on the special expertise of the Visiting Professor, Rotating PhD, or a senior faculty member. This course may also be offered as an AIAD course at USMA. This course will contain significant lab content to justify 3.5 credit hours.

2029-3

**Lessons:** 40 @ 55 min (2.500 Att/wk)

**Labs:** 7 @ 120 min

**Special Requirements:**

None

**Prerequisite(s):**

CH102  
-Or-  
CH152

| The cadet pursues study of a research or design topic in civil engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but include defining the problem, studying the fundamentals involved, organizing an approach, performing research, achieving a solution, submitting a written report, and giving a formal briefing. |                                                                                                                                                                                                                                                  | 2026-1 2026-2 2027-2<br>2028-2 2029-2                  |

| The cadet pursues study of a research or design topic in civil engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but include defining the problem, studying the fundamentals involved, organizing an approach, performing research, achieving a solution, submitting a written report, and giving a formal briefing. |                                                                                                                                                                                                                                                  | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-2 |

| This course introduces cadets to the civil engineering profession. The course consists of classroom instruction and activities that addresses who civil engineers are, what they build, how they design, and how the West Point Civil Engineering program prepares cadets to enter the profession.                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                  | 2026-1 2027-1 2028-1<br>2029-1                         |

| The cadet pursues study of a research or design topic in civil engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but include defining the problem, studying the fundamentals involved, organizing an approach, performing research, achieving a solution, submitting a written report, and giving a formal briefing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                  | 2026-1 2026-2 2027-1<br>2028-1 2029-1                         |

| The cadet pursues study of a research or design topic in civil engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but include defining the problem, studying the fundamentals involved, organizing an approach, performing research, achieving a solution, submitting a written report, and giving a formal briefing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                  | 2026-1 2027-1 2028-1<br>2029-1                                |

| The cadet pursues study of a research or design topic in civil engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but include defining the problem, studying the fundamentals involved, organizing an approach, performing research, achieving a solution, submitting a written report, and giving a formal briefing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                  | No Course Offerings                                           |

| This course identifies, analyzes, and assesses built infrastructure which is the foundation for modern society. The complex and interconnected nature of infrastructures is investigated and demands on critical components are calculated. Students explore the non-technical factors necessary for the functioning of infrastructure including supplies, trained personnel, and cross-sector dependencies. The course provides a basis for understanding the complexity and cost of maintaining, rebuilding and developing infrastructure. Major blocks of instruction include water and wastewater, power, transportation, solid waste, communications systems, and sustainability. Several in-class scenarios are provided to synthesize the connectivity between the major items of infrastructure. Finally, as infrastructure is one of the six variables in the joint operating environment, the knowledge gained is employed to analyze infrastructure in the context of combat operations. |                                                                                                                                                                                                                                                  | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

|--------------|-------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

This course studies the behavior of a variety of materials under normal, shear, torsional, bending and combined loads. The concepts of stress, strain, failure theory and failure mechanisms are explored. The loading, geometry, functional environment and material properties of machine or structural parts are used to relate the forces applied to a body to the resulting internal forces and deformations so that performance can be evaluated. Practical applications involving the design and adequacy of mechanical and structural elements under various loading and environmental conditions are emphasized. The course includes several laboratory experiences that require students to develop and conduct experiments, analyze and interpret data, and use engineering judgement to draw conclusions.

**Scope:** 2026-1

**Offerings:**

Soil Mechanics is the study of soil properties which govern the use of soil as a construction or foundation material. The course is devoted to describing soils, analyzing soil stresses, determining consolidation settlement, designing earth embankments, determining earth pressures, and designing foundations based upon applicable engineering principles and recognition of the fundamental concepts of soil behavior. The course includes several laboratory experiences that require students to develop and conduct experiments to examine soil properties, analyze and interpret data, use engineering judgement to draw conclusions, and extract necessary parameters for design.

**Scope:** 2026-1

**Offerings:**

This course studies both hydrology, which is the study of occurrence, movement and distribution of rainfall, and hydraulic design, which is the application of fluid mechanics and other science and engineering disciplines in the design of structures and development of water resources. Hydrologic principles are applied to model and analyze the distribution and movement of rainfall in a watershed. Hydraulic principles are applied to analyze and design flow through systems of reservoirs, channels and culverts. The course makes extensive use of computer simulation models used in engineering practice. The course includes several laboratory experiences that require students to develop and conduct experiments, analyze and interpret data, and use engineering judgement to draw conclusions.

The cadet pursues study of a research or design topic in civil engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but include defining the problem, studying the fundamentals involved, organizing an approach, performing research, achieving a solution, submitting a written report, and giving a formal briefing.

**Lessons:** 40 @ 55 min (0.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Enrollment by permission of Civil Engineering Program Director. Other requirements as determined by the Faculty Advisor. The program director will determine the applicable amount MA, BS and ET credit for each course offering, when required.

This course provides cadets with an opportunity to learn and practice the field aspects of civil engineering. Topics include plane surveying, introduction to construction materials, wood frame building construction, heavy equipment operations, concrete placement and finishing, roadway construction, steel fabrication, reinforced concrete construction, bridge construction, power production, and environmental systems. Cadets perform actual construction projects as part of course requirements. LESSONS and LABS: 12 lessons of varying length, scheduled across three weeks of full-day instruction during the summer.

**Lessons:** 12 @ 0 min (0.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** TDY travel to the course location at the U.S. Air Force Academy.

| This course prepares cadets to enter the civil engineering profession. The course consists of classroom discussions and activities that address career planning and analyzing issues in engineering ethics and sustainability. The course introduces processes to identify, formulate, and solve complex engineering problems. The processes develop the recognition of ethical and professional responsibilities in engineering judgments considering the impact of solutions in global, economic, environmental, and societal contexts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                  | 2026-2 2027-2 2028-2<br>2029-2                                                 |

| This course addresses the analysis of basic structural forms such as beams, trusses, and frames, which are found in bridges and buildings. Classical deflection techniques such as direct integration and virtual work; and indeterminate analysis techniques such as the force method and displacement method (specifically direct stiffness) are used to determine forces and deflections in elastic structures. Structural analysis computer programs are introduced and directly applied in the solution of graded analysis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                  | 2026-1 2027-1 2028-1<br>2029-1                                                 |

| This course teaches the engineering thought process through the design of steel structures. The course synthesizes the fundamentals of statics, mechanics of materials, and structural analysis and applies them to the design of structural members, with emphasis on satisfying real-world needs. Topics include an introduction to the design of structural systems, design of steel tension and compression members, design of beams and beam-columns, and an introduction to connection design. Students read, interpret and create structural plans using an intelligent 3D digital modeling and design software. Students analyze structural systems and elements using finite element modeling software. All design is performed in accordance with codes and specifications used in current engineering practice. A comprehensive design problem requires development of a design methodology, consideration of alternative solutions, and design of an optimal steel structure to meet stated functional requirements. |                                                                                                  | 2026-2 2027-2 2028-2<br>2029-2                                                 |

| This course focuses on the implementation portion of the design process. The management of construction is covered to include scope of work, rough order-of-magnitude estimating, scheduling, planning, progress reporting, resource constraining, and quality control. The roles of the contractor, owner, and designer are explained. An iterative decision-making design process is developed and applied in multiple contexts that requires developing requirements, performing analysis and synthesis, generating multiple solutions, evaluating solutions against requirements, considering risks, and making trade-offs, for the purpose of obtaining a high-quality solution under given circumstances.                                                                                                                                                                                                                                                                                                                  |                                                                                                  | 2026-1 2026-2 2027-1<br>2027-2 2027-8 2028-1<br>2028-2 2028-8 2029-1<br>2029-2 |

| Students will extend what they learned in Soil Mechanics and Foundation Engineering and design advanced foundations in this course. Topics covered are: slope stability, field testing, field instrumentation, designing braced excavations, designing piles and drilled shafts, designing flexible walls, designing earth retaining structures, and designing earth structures using geosynthetics.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                | 2026-1 2027-1 2028-1 2029-1                                    |

| The course introduces the materials and mechanical properties of concrete, and the design of reinforced concrete structures. Mix design and strength testing labs develop the concept of proportioning constituents for quality concrete and provide a background in techniques of material testing, quality control, and sound construction practices. The study of reinforced concrete and masonry includes analysis and design of simple structures, resulting in an appreciation for the strength and serviceability of these structures. Current codes and standards are used to guide the practical design of beams, slabs, columns, and footings. The course includes several laboratory experiences that require students to develop and conduct experiments, analyze and interpret data, and use engineering judgement to draw conclusions. |                                                                                                                                                                                                                                | 2026-1 2027-1 2028-1 2029-1                                    |

| The cadet, on an individual or small group basis, pursues advanced study of a research or design topic in civil engineering. The scope of the course is tailored to the needs of the project and desires of the cadet, in consultation with the Faculty Advisor. The cadet is required to define and analyze the problem, study the fundamentals involved, organize an approach, determine a procedure, perform research and/or achieve a solution, submit a written report, and give a formal briefing.                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                | 2026-1 2026-2 2026-9 2027-1 2027-2 2028-1 2028-2 2029-1 2029-2 |

| The cadet, on an individual or small group basis, pursues advanced study of a research or design topic in civil engineering. The scope of the course is tailored to the needs of the project and desires of the cadet, in consultation with the Faculty Advisor. The cadet is required to define and analyze the problem, study the fundamentals involved, organize an approach, determine a procedure, perform research and/or achieve a solution, submit a written report, and give a formal briefing.                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                | 2026-1 2026-2 2027-1 2027-2 2028-1 2028-2 2029-1 2029-2        |

Many CE489A projects will have a significant laboratory requirement. The program director will determine the applicable amount MA, BS and ET credit for each course offering, when required. |                                                                |

| The cadet, on an individual or small group basis, pursues advanced study of a research or design topic in civil engineering. The scope of the course is tailored to the needs of the project and desires of the cadet, in consultation with the Faculty Advisor. The cadet is required to define and analyze the problem, study the fundamentals involved, organize an approach, determine a procedure, perform research and/or achieve a solution, submit a written report, and give a formal briefing. Cadets will typically enroll in CE489B if they have already completed CE489 and CE489A.                                                                                                                                                                                                                                                                 |                                                                                                                              | No Course Offerings                                |

The course is intended to broaden the cadet's exposure to the civil engineering discipline. Course content will be based on the special expertise of the visiting professor or a senior civil engineering faculty member.                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                              | No Course Offerings                                |

| This course builds upon the material covered in CE403/453 to develop a better understanding of structural behavior. Two-dimensional analysis of trusses and frames is reviewed and extended into 3D. Matrix analysis methods, including an introduction to continuum finite elements are developed as the basis for modern computer-based structural analysis. An introduction to nonlinear analysis is presented. Coursework involves extensive use of the computer as an analytical tool. Students use state-of-the-art structural engineering analysis and design software.                                                                                                                                                                                                                                                                                   |                                                                                                                              | 2026-2 2027-2 2028-2<br>2029-2                     |

| This course challenges students to identify, formulate, and solve a complex engineering problem in teams. The design problems will be open-ended in nature and involve the application of math, science, and engineering principles acquired in previous coursework. In teams, students will use an iterative design process to define the problem and requirements, analyze alternatives within constraints (e.g., applicable codes and standards), and select the best alternative to solve the problem. The design process will take into consideration public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors. Teams will communicate their process and solution through written deliverables and presentations to a range of audiences. Work on this problem will continue in the next course: CE494. |                                                                                                                              | 2026-1 2027-1 2028-1<br>2029-1                     |

| This course continues the engineering design process initiated in CE493. In teams, students will model, test, implement, and communicate their solution to a complex engineering problem. The iterative design process will consider applicable codes and standards along with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors. Teams will communicate their process and solution through written deliverables and presentations to a range of audiences. |        | 2026-2 2027-2 2028-2 2029-2 |

| This course provides cadets with a solid introduction to the principles of transportation engineering with a focus on highway engineering and traffic analysis. The material learned will provide the basic skill set that will allow students to solve transportation problems that are likely to appear in professional practice (civilian and military), on the Fundamentals of Engineering exam (FE), and on the Principles and Practice of Engineering exam (PE). |        | 2026-1 2027-1 2028-1 2029-1 |

| Public infrastructure designed by civil and environmental engineers underpins modern society. However, day-to-day, its benefits often are taken for granted and its hidden costs become more evident over time. In this introductory course to the Environmental Engineering and Infrastructure Engineering Core Engineering Sequences, students will discuss the maintenance of public trust through the inclusion of resilience and sustainability concepts in infrastructure design and design implementation. Students will study methods to qualify and quantify the social, economic, and environmental benefits and costs of infrastructure emplacement and operation. Students will be introduced to the engineering design process in which they will seek to minimize examined costs and maximize value to partners using a methodical decision-making process. The course will culminate with a term project addressing an Army Civil and/or Environmental Engineering need. |        | 2026-2            |

| Thermal-Fluid Systems is an integrated study of fundamental topics in thermodynamics and fluid mechanics. The course introduces conservation principles for mass, energy, and linear momentum as well as the 2nd Law of Thermodynamics. Principles are applied to incompressible flow in pipes, open channels and turbomachinery and power generation systems, focusing on engineering applications. Laboratory exercises are integrated into classroom work. This course includes completion of a comprehensive, out-of-class design problem. This design problem provides the opportunity for students to apply engineering science and the engineering design process to a hands-on project. Lesson length varies between 75 minutes and 55 minutes (and corresponding preparation time varies as well). **This course is a pilot in AY26-2 and AY27-2. It must undergo review by the Curriculum Committee NLT AY28-1 to continue. ET = 3.5CR pending ABET-PEV review.** |        | 2026-2 2027-2     |

**Offerings:**

2026-1

This course introduces Cadets to the environmental engineering profession to gain an appreciation for the interdisciplinary nature of the field. Fundamentals regarding engineering design are presented and a variety of tools are used to analyze and visualize solutions to environmental challenges. The course provides a platform for the incorporation of required skills students use throughout the rest of their engineering course of study. Cadets solve a series of progressively more complex engineering problems by applying the design process while addressing public health, safety, and welfare. The course introduces a variety of techniques to communicate effectively with a range of audiences as Cadets function effectively on teams and apply new knowledge and learning strategies.

**Lessons:** 40 @ 55 min (2.500 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** Open to EVE1 majors. Any exceptions must be pre-approved by the Environmental Engineering Curriculum Coordinator.

2026-1 2026-2 2027-1  
2027-2 2028-1 2028-2  
2029-1 2029-2

The course is an individually supervised research and study program designed to familiarize cadets with introductory scientific procedures, techniques, and topics. The cadet and advisor prepare a research and study proposal setting forth the objectives, scope, and anticipated accomplishments of his/her efforts for the semester. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Once approved, the proposal serves as a basis for the cadet's research and study program. Progress in research reports and observations by the faculty advisor form the basis for grades. Activities vary by project, but the primary purpose is to acquaint students with essential skills required for independent research. If required for a specific degree, the proposal will include a justification for engineering science or design credit.

**Lessons:** 0 @ 0 min (0.000 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** Enrollment by permission of the appropriate CEE program director. Other requirements as determined by the faculty advisor and EV289A course director. Discipline-specific final product is required.

**Offerings:**

The course is an individually supervised research and study program designed to familiarize cadets with introductory scientific procedures, techniques, and topics. The cadet and advisor prepare a research and study proposal setting forth the objectives, scope, and anticipated accomplishments of his/her efforts for the semester. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Once approved, the proposal serves as a basis for the cadet's research and study program. Progress in research reports and observations by the faculty advisor form the basis for grades. Activities vary by project, but the primary purpose is to acquaint students with essential skills required for independent research. If required for a specific degree, the proposal will include a justification for engineering science or design credit.

2027-2 2028-2 2029-2

**Lessons:** 0 @ 0 min (0.000 Att/wk)**Labs:** 0 @ 0 min**Special Requirements:**

Enrollment by permission of the appropriate CEE program director. Other requirements as determined by the faculty advisor and EV289B course director. Discipline-specific final product is required. Cadets will take EV289A/B before enrolling in EV289C.

|--------------|------------------------------|----------------------------------------------------------|

---

**Scope:**

2026-1

**Offerings:**

As the introductory course to the Environmental Engineering Sequence, EV300 provides a broad understanding of current global and local environmental issues. It specifically focuses on natural ecosystems processes, the effects of pollution on human health, assessing the level of risk associated with pollution, and the environmental effects of energy use, air pollution, global climate change, acid rain, and smog. Discussions of anthropogenic influences on the environment also consider social, economic, technological and political impacts. Cadets learn to evaluate environmental issues through current events and interactive debates. A course project requires cadets to apply the scientific method to evaluate a current environmental problem and provides an opportunity to integrate multiple course topics with an in-depth study of an issue of interest.

|--------------|-------------------------------------|----------------------------------------------------------|

---

**Scope:**

2026-1

**Offerings:**

EV301 provides the cadet with an overview of current global and local environmental issues through the lens of sustainable practices. It specifically focuses on natural ecosystem processes, the effects of pollution on human health, assessing the level of human health risk associated with pollution, and the strain on natural resources that stem from population growth. Discussions of anthropogenic influences on sustainability include social, economic, technological, and political factors. Cadets evaluate environmental issues through review of scientific literature, current events, and interactive debates. A course project requires cadets to conduct an in-depth life cycle assessment (LCA) of an activity or product. The project results in a foundation of engineering science that facilitates follow-on engineering design.

---

**Scope:**

2026-1

**Offerings:**

This course builds on environmental issues introduced in EV300 and further explores environmental engineering from a unit process and materials balance approach. Analyzing water (transport, quality, drinking water treatment, and wastewater treatment) and air (transport, quality, and pollutant minimization), the cadet is exposed to the breadth of the environmental discipline. A laboratory experience is integral to the course. In the laboratory, physical, chemical, and biological quality are discussed and measured. An introductory environmental engineering design project on river water quality and wastewater treatment plant design is developed within the semester.

**Lessons:** 34 @ 55 min (2.500 Att/wk)      **Labs:** 3 @ 110 min

**Scope:** 2026-1

**Offerings:**

This course covers the principles governing the movement of subterranean water (groundwater), the interaction of this water with the porous medium, and the transport of chemical constituents (contaminants) in the subsurface. Lesson blocks explore traditional background elements of hydraulic engineering to include flow systems for the conveyance of groundwater and drainage systems for groundwater. Computer models are used to evaluate groundwater problems and conduct sensitivity analyses.

| This course will examine biology from a practical environmental engineering and environmental science perspective. The foci of the course are applied public health, microbiology and microbial energetics. Specific topics include the biological health issues associated with drinking water, microbial aspects of industrial and domestic waste treatment and protection or restoration of natural water bodies from environmental contaminants. Students are also introduced to medical geography and the spatial biological health issues associated with a deployment. Laboratory exercises are used to introduce the student to water quality analyses and practices commonly used in the fields of environmental engineering and the environmental sciences. |        | 2026-2 2027-2 2028-2<br>2029-2 |

| This course employs a design approach to air pollution control. It begins by defining air pollution problems, to include pollutant types, sources, legislation, and effects on both local and global scales. The course then examines the design of various means of controlling particulate and gaseous air pollution from both mobile and stationary sources. Finally, students study the link between meteorology and air pollution, as well as pollutant dispersion modeling in the atmosphere. A course project involves collection and analysis of indoor air quality data at selected locations on the installation. |        | 2026-2 2027-2 2028-2<br>2029-2 |

| This seminar will meet once each week and will include all first class cadets majoring in environmental engineering. The seminar topics will address a variety of fundamental engineering science, design, and professional practice topics including engineering ethics, economics, and licensing. Periodically, guest lecturers from the military, industrial, and academic communities will provide their perspective on these topics.                                                                                                                                                                                                                                                                                                                                                                                      |                                                                           | No Course Offerings                                           |

| This course takes a process approach to environmental engineering using engineering science and design of drinking water treatment systems as the primary foci. Building upon concepts gained in environmental chemistry, cadets study physical and chemical processes used in environmental engineering. Discussion includes the theories behind these processes and the design procedures involved in their application. Cadets develop comprehensive concept design of drinking water treatment processes. While the focus of the course is drinking water treatment, the processes developed are also applicable to wastewater treatment, groundwater remediation, air pollution control, and the treatment of solid and hazardous wastes.                                                                                 |                                                                           | 2026-1 2027-1 2028-1<br>2029-1                                |

| This course applies principles from environmental biotechnology, microbial ecology, and environmental microbiology to educate cadets how to treat wastewaters and sludges. The course explores the design of longstanding wastewater treatment technologies and approaches, while introducing cadets to emerging applications of biochemical wastewater treatment and resource recovery. Modeling approaches for designing wastewater treatment works using biochemical reactors are also introduced. A comprehensive, multi-step laboratory project serves as the culminating course project.                                                                                                                                                                                                                                 |                                                                           | 2026-1 2027-1 2028-1<br>2029-1                                |

| This course is the capstone experience for a three-course environmental engineering sequence. With a focus on water and sanitation challenges in the developing world, students assess various technologies and their ability to meet community needs. The course highlights the engineering design process to develop appropriate solutions and introduces decision modeling with consideration of social, political, and economic factors. A semester-long term project leverages real world case studies to provide cadet teams an opportunity to apply knowledge and creatively design sustainable solutions to ill-defined problems. Students must make logical assumptions throughout the project, present and evaluate solution designs, and prepare a formal written report defending their selected course of action. |                                                                           | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| In this course, students explore the effective use of water as a manageable natural resource. The course begins with instruction on the tools required by water resource managers to make sound decisions in their field. The course assesses current needs for water and the structural (engineered) and non-structural approaches available to meet these needs. Elements of engineering design and the design process are introduced. The bulk of the course is concerned with assessment of the impacts of various water resources development activities on the economic, socio-cultural and ecological sectors of the environment. Methods for conducting tradeoff analyses among the engineered and environmental aspects of projects are developed and applied in a term project. The course makes use of case studies of current water resource projects. Visiting speakers discuss topics relevant to water resource management.                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                             | 2026-2 2027-2 2028-2<br>2029-2                                       |

| This course examines the treatment, storage and disposal of solid and hazardous wastes. Both regulatory requirements and evolving technology associated with solving modern solid waste disposal problems are discussed. Design of remediation processes for cleanup of contaminated waste sites are presented. Students will complete a term project related to subsurface remediation that will involve design and experimentation to assess the efficiency of a hazardous waste treatment and remediation process. **The 3.0CR version of this course is a pilot and must undergo review by the Curriculum Committee NLT AY26-1 to continue.**                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                             | 2026-2 2027-2 2028-2<br>2029-2                                       |

| The course is an individually supervised research and study program designed to provide cadets the opportunity to pursue advanced scientific procedures, techniques, and/or topics within their discipline. The cadet and faculty advisor prepare a research proposal setting forth the objectives, scope, and anticipated accomplishments of his/her efforts for the semester. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Once approved, the proposal serves as a basis for the cadet's research and study program. Progress in research reports and observations by the faculty advisor form the basis for grades. Lessons and labs are established by consultation between the cadet and faculty advisor. The program for each cadet will culminate in one of two outcomes: 1) discipline-appropriate final written report (e.g., senior thesis) with presentation in a public forum (e.g., Projects Day); or 2) enrollment in EV489B for continued research and independent study at a 3.0-credit level. If required for a specific degree, the proposal will include a justification for engineering science or design credit. Program Director will determine the applicable MA, BS, and ET credits for each offering, as required. |                                                                                                                                                                                                                             | 2026-1 2026-2 2026-7<br>2027-1 2027-2 2028-1<br>2028-2 2029-1 2029-2 |

| <p>The course is an individually supervised research and study program designed to provide cadets the opportunity to pursue advanced scientific procedures, techniques, and/or topics within their discipline. The cadet and faculty advisor prepare a research proposal setting forth the objectives, scope, and anticipated accomplishments of his/her efforts for the semester. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Once approved, the proposal serves as a basis for the cadet's research and study program. Progress in research reports and observations by the faculty advisor form the basis for grades. Lessons and labs are established by consultation between the cadet and faculty advisor. The program for each cadet will culminate in one of two outcomes: 1) discipline-appropriate final written report (e.g., senior thesis) with presentation in a public forum (e.g., Projects Day); or 2) enrollment in EV489C for continued research and independent study at a 3.0-credit level. If required for a specific degree, the proposal will include a justification for engineering science or design credit. Program Director will determine the applicable MA, BS, and ET credits for each offering, as required.</p> <p><b>Lessons:</b> 0 @ 0 min (0.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> Enrollment by permission of the appropriate CEE program director.<br/>Discipline-appropriate final written report with presentation in a public forum required prior to completion of a cadet's culminating research course.</p> <p><b>Prerequisite(s):</b> EV480<br/>-Or-<br/>EV489A</p> |                                       | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| <p>The course is an individually supervised research and study program designed to provide cadets the opportunity to pursue advanced scientific procedures, techniques, and/or topics within their discipline. The cadet and faculty advisor prepare a research proposal setting forth the objectives, scope, and anticipated accomplishments of his/her efforts for the semester. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Once approved, the proposal serves as a basis for the cadet's research and study program. Progress in research reports and observations by the faculty advisor form the basis for grades. Lessons and labs are established by consultation between the cadet and faculty advisor. The program for each cadet will culminate in a discipline-appropriate final written report (e.g., senior thesis) with presentation in a public forum (e.g., Projects Day). If required for a specific degree, the proposal will include a justification for engineering science or design credit. Program Director will determine the applicable MA, BS, and ET credits for each offering, as required.</p> <p><b>Lessons:</b> 0 @ 0 min (0.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> Enrollment by permission of the appropriate GENE program director.<br/>Discipline-appropriate final written report with presentation in a public forum required prior to completion of a cadet's culminating research course.</p> <p><b>Prerequisite(s):</b> EV489A EV489B EV489C</p>                                                                                                                          |                                       | 2026-2                                                        |

This is the first in a sequence of two courses that comprise the environmental engineering integrative experience. In this senior engineering design course, teams of cadets apply the engineering design process to develop alternative solutions to complex, open-ended environmental engineering problems. In addition, cadets are introduced to techniques, skills, and modern engineering tools required for the engineering design process. The course culminates with a decision brief and report in which teams present a conceptual (35%) design for their recommended solution alternative, as well as their analysis of the engineering, social, economic, and environmental criteria that led them to recommend this course of action. The approved design alternative will be completed the following semester in EV491 Advanced Environmental Engineering Design. \*The 3.5CR version of this course is a pilot for AY24-1, AY25-1, and AY26-1 and will be updated on approval by the General Committee in AY26.\*

**Lessons:** 30 @ 160 min (2.000 Att/wk) **Labs:** 0 @ 0 min

**Special Requirements:** Standing as a first class cadet.

**Prerequisite(s):** EV481

**Scope:** 2026-1

**Offerings:**

This is the second in a sequence of two courses that comprise the environmental engineering integrative experience. In this senior engineering design course, teams of cadets refine and finalize the conceptual designs they produced at the end of EV490 to solve a complex, open-ended environmental engineering problem. Ensuring that the complete design meets specified engineering, social, environmental, and economic criteria, they present the results both orally and in a written report. This course also introduces cadets to the engineering profession, to include engineering ethics and an emphasis on continued study to earn professional certifications. \*The 3.5CR version of this course is a pilot for AY24-2 and will be updated on approval by the General Committee in AY25.\*

**Lessons:** 30 @ 160 min (2.000 Att/wk) **Labs:** 0 @ 0 min

**Special Requirements:** One design problem. Standing as a first class cadet is required for enrollment.

**Prerequisite(s):** EV490

---

**Scope:** 2025-4

**Offerings:**

The engineering design process and the method of design are introduced. Principles of equilibrium are used to analyze forces on statically determinate rigid bodies and structures to include trusses and frames. The behavior of deformable bodies under axial and flexural loading is examined. The concepts of stress, strain, and material properties are introduced and are used to relate external forces applied to a body to the resulting internal forces and deformations so that performance can be evaluated. Practical applications involving the design and adequacy of mechanical and structural elements under various loading conditions are emphasized.

**Lessons:** 20 @ 75 min (1.250 Att/wk) **Labs:** 10 @ 75 min

**Special Requirements:** None

**Scope:** 2026-1

**Offerings:**

This course examines chemical interactions of pollutants in air, soil, and water systems. The focus of the course is problem solving with the following topic coverage: approximately 80% applied aquatic chemistry, 15% environmental organic chemistry, and 5% applied analytical chemistry. Specific topics include the chemistry applied in drinking water production and the chemical aspects of industrial and hazardous waste treatment. The fate of heavy metals and organic contaminants in soil and aqueous systems is also discussed.

**Lessons:** 30 @ 75 min (2.000 Att/wk) **Labs:** 0 @ 0 min

**Special Requirements:** One in-class lab.

| <p>This course provides an introduction to the fundamentals of computing, cyberspace, and artificial intelligence (AI). The course presents basic program design and construction techniques, with consideration given to principles of software engineering. Problem solving using computing devices and AI tools is a central theme throughout the course as students employ various design methodologies. Students utilize an integrated development environment and contemporary application software. Emphasis is placed on critical thinking, creativity, and learning how to learn. Students are introduced to legal, ethical, professional, and security issues and the challenges, opportunities, and attributes of the cyber domain, including AI.</p>                                                     |                                                                             | 2026-1 2026-2 2026-4<br>2026-5 2027-1 2027-2<br>2027-4 2027-9 2028-1<br>2028-2 2028-4 2028-9<br>2029-1 2029-2 2029-4<br>2029-5 |

Students utilize an integrated development environment and contemporary application software. Emphasis is placed on critical thinking, creativity, and learning how to learn. Students are introduced to legal, ethical, professional, and security issues and the challenges, opportunities, and attributes of the cyber domain. *This is a pilot course and must undergo review by the Curriculum Committee NLT AY26-2 to continue.*</p> |                                                                             | 2026-1                                                                                                                         |

| <p>This course provides a more advanced opportunity to explore the fundamentals of computing and Cyberspace. The course presents basic program design and construction techniques, with consideration given to principles of software engineering. Problem solving using computing devices as tools is a central theme throughout the course as students employ various design methodologies. Students utilize an integrated development environment and contemporary application software. Emphasis is placed on critical thinking, creativity, and learning how to learn. Students are introduced to legal, ethical, professional, and security issues and the challenges, opportunities, and attributes of the cyber domain.</p>                                                                                  |                                                                             | No Course Offerings                                                                                                            |

| Cadets learn fundamental computing concepts that will allow them to design, build and test small to medium programs using a high-level programming language. Key concepts include applying appropriate aspects of a structured problem-solving process, applying a standardized design notation such as the Unified Modeling Language (UML) to communicate their design, and iteratively testing their program. **This is a placeholder course for the new Artificial Intelligence and Data Engineering Core Engineering Sequence. Course Scope will be updated NLT AY26-1.**                                                                                                                                                                            |                                                                             | 2026-2 2027-1 2027-2<br>2028-1 2028-2 2029-1<br>2029-2 |

| Cadets engineer a data-processing pipeline in a high-level programming language, which includes the acquisition of data from various sources and the cleaning, transformation, and storage of that data via flat files and other various storage systems. Cadets explore the data and visualize it to gain understanding and insights to ultimately make predictions, solve problems, and aid in decision-making. **This is a provisionally approved course for the Artificial Intelligence and Data Engineering Core Engineering Sequence. AI350 must undergo review by the Curriculum Committee NLT AY26-1 to continue.**                                                                                                                              |                                                                             | 2026-2 2027-1 2027-2<br>2028-1 2028-2 2029-1<br>2029-2 |

| Cadets explore the potential of data-driven artificial intelligence (AI) algorithms to solve complex engineering problems. Cadets build models that rival and even surpass human-level performance on a range of tasks. Cadets analyze problems, design and compare models suited to the objective, and implement their approach in software. The course culminates in an open-ended project of the cadets' choosing. In this project, cadets build a model that achieves superior results on a task that would otherwise require human cognition to perform. **This is a provisionally approved course for the Artificial Intelligence and Data Engineering core engineering sequence. It must undergo review by the Curriculum Committee NLT AY26-2.** |                                                                             | 2026-2 2027-1 2027-2<br>2028-1 2028-2 2029-1<br>2029-2 |

| This course provides an introduction to computer systems, computer organization and related concepts. Emphasis is placed on understanding the implications of computer hardware and architecture on the performance and security of written code. Students learn basic C programming and assembly language. Topics covered include basic computer organization, architecture, reverse engineering and parallel computing. In addition to theory, students gain practical real-world experience using tools for profiling and debugging. By the end of this programming-intensive course, students will understand how the fundamental principles of computer systems impact their ability to write efficient code.                                                                                                                                                                                                                                                                                                  |                                                           | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2                  |

| This course is designed to build on the cadet's basic programming knowledge. Major emphasis is placed on object-based design, programming methodology, algorithms and algorithm analysis, data structures, and abstract data types as tools for the analysis, design, and implementation of software modules to meet specified requirements. Cadets will learn and employ several well-known algorithms and data structures. Techniques of searching, sorting, recursion, and hashing will be examined. Data structures such as sets, heaps, linked lists, stacks, queues, and trees will be covered. A block-structured programming language reflecting comprehensive support for good software engineering principles will be the foundation of application-oriented exercises. Cadets will design software solutions by employing problem decomposition and selecting the appropriate algorithms and abstract data types.                                                                                        |                                                           | 2026-1 2026-2 2027-1<br>2027-2 2027-8 2028-1<br>2028-2 2028-8 2029-1<br>2029-2 |

| This course studies analysis of algorithms and the relevance of analysis to the design of efficient computer algorithms. Algorithmic approaches covered include greedy, divide and conquer, and dynamic programming. Topics include sorting, searching, graph algorithms, and disjoint set structure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                           | 2026-2 2027-2 2027-9<br>2028-2 2028-9 2029-2<br>2029-8 2029-9                  |

| This course builds solely on basic programming skills to introduce the field of deep learning, neural network architectures, and learning algorithms in a way accessible to cadets pursuing a variety of majors. Cadets will develop an understanding of emerging trends and research in the field. Major emphasis is placed on applying neural networks to problems in a variety of domains by training and tuning models for tasks such as pattern recognition, time series prediction, data mining, and optimization. Hands-on exercises, programming assignments, and case studies will provide cadets with valuable experience using state-of-the-art software libraries and pre-trained models (PTMs). The course culminates in an open-ended project of the cadets' choosing but intended to be an application of course content to cadets' personal research projects. *This is a pilot course and must be reviewed by the Curriculum Committee NLT AY26-1 to continue. ET credit pending ABET-PEV review." |                                                           | No Course Offerings                                                            |

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** None

**Prerequisite(s):** CY300

**Scope:** 2022-2

**Offerings:**

The student pursues study of a topic in Computer Science on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the student based on resources and in consultation with a faculty advisor. The cadet will formalize a proposal, design a viable research plan, or conduct research under the guidance and supervision of a faculty member. In consultation with a faculty advisor, the student will write a proposal that outlines the scope of the project, includes graded requirements, and establishes lesson and lab meetings, as appropriate. Proposals must be approved by the Department Head.

| The student pursues study of a topic in Computer Science on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the student based on resources and in consultation with a faculty advisor. The cadet will formalize a proposal, design a viable research plan, or conduct research under the guidance and supervision of a faculty member. In consultation with a faculty advisor, the student will write a proposal that outlines the scope of the project, includes graded requirements, and establishes lesson and lab meetings, as appropriate. Proposals must be approved by the Department Head. |                                                                                                                             | 2029-1                                             |

**Scope:** 2022-2

**Offerings:**

This course addresses the analysis, design implementation, and management of relational databases. Structured query language (SQL) is covered in depth along with standard problem domain and data modeling techniques. Implementation techniques and considerations are discussed and practiced extensively. Key concepts include analysis and design using a standardized notation, data model to logical schema conversion techniques, normalization, data security, client-server architectures and web-based access to database systems. Students are exposed to user and privilege management, database backup and recovery, and security vulnerabilities such as SQL injection.

2029-1

Building on the foundations of algorithm implementation, data structures, data representation, and object oriented programming this course focuses on the principles of designing, implementing, and testing a modern distributed application. Cadets study the construction and interaction of user interface, network, web server, database, and other components to produce an integrated working secure system. Cadets will learn new tools and skills working as a team to analyze, design, and implement a system that solves a given problem. This is one of the courses that a Computer Science major can choose from a list of elective courses and the focus is on data structure concepts and object oriented programming.

This course addresses professional considerations for computing professionals, primarily focusing on non-technical considerations and the development of communication skills. Coursework includes significant emphasis on written work that is based on relevant reading assignments, class discussions, individual research, distinguished guest speakers, and personal reflection. Content will address current, emerging, and relevant topics in the computing profession. Students will develop the ability to recognize professional responsibilities and make informed judgments in computing practice based on legal and ethical principles. They will also learn to identify and discuss local and global impacts of computing solutions on individuals, organizations, and society. Students will demonstrate the ability to communicate effectively in writing in a variety of professional contexts, including an iterative writing experience.

**Scope:** 2019-2

**Offerings:**

This course concerns computer programs that draw two- and three-dimensional objects on computer output devices and receive input from users through graphical input devices. Cadets implement interactive programs through a commonly available graphical application programmers' interface (API). They learn about graphical hardware devices and the elegant algorithms that underlie the API, including elementary computational geometry, continuous time physical simulation, homogeneous transformations, parametric forms, clipping, shading, color, and surface rendering. These concepts are all illustrated with examples of military data visualization including two-dimensional maps and three-dimensional battle simulation and terrain visualization.

**Scope:** 2023-2

**Offerings:**

This course introduces computer science theory through the study of abstract machines, grammars, languages, decidability, and NP-completeness. Students evaluate fundamental limits of these machines and grammars and classify languages according to the Chomsky hierarchy; apply various techniques to prove facts about these machines, grammars, and languages; recognize the difference between problems that are and are not solvable; and determine when a problem is NP-complete. Throughout, the course links fundamental computer science theory to modern-day practical computing devices and computational problems.

| Concepts of high-level programming language design are explored in detail. Cadets will examine the fundamental issues of programming language design and use this knowledge as a framework for comparison of different high-level languages. Cadets will study concepts from some or all of the imperative, functional, object-oriented, concurrent, and logic programming language paradigms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                | 2026-1 2027-1 2028-1 2029-1                                           |

| The operating system controls the computer itself and provides a secure and useful interface for users and application programs. The operating system controls all the computer resources: processors, main storage, secondary storage, I/O devices, and files. It determines which programs will be in memory at any given time and the order in which programs will run. The operating system should resolve conflicts between processes, attempt to optimize the performance of the computer, allow the computer to communicate with other computers, and maintain a record of actions performed as it goes about its system tasks. This course investigates the basic design issues encountered in order to produce an operating system that can address the above problems in an efficient manner. These concepts are reinforced by a series of programming projects that include both design and implementation. |                                                | 2026-1 2027-1 2028-1 2029-1                                           |

| Digital Forensics will explore the evidence left behind when malicious activity occurs on an information system. The material in this course will build on your knowledge of Operating Systems, file formats, file system structure, computer architecture, and networking. The course begins with an overview of these areas, then examines how to find and extract digital evidence. During the course, you will be challenged with three projects (subjects to be chosen by you) and in class challenges that will allow you to demonstrate your understanding of the material.                                                                                                                                                                                                                                                                                                                                     |                                                | 2026-2 2027-2 2028-2 2029-2                                           |

| This course builds on an understanding of basic networking topics and provides cadets with an advanced understanding of computer networks. This course explores more deeply the problems facing modern computer networks. It covers advanced networking techniques that are enabling rapid innovation to solve challenges in routing, congestion control, traffic engineering, mobility, and reliability. Specific topics covered will vary but may include software-defined networking and programmable network devices.                                                                                                                                                                                                                                                                                                                                                                                              |                                                | 2026-1 2026-2 2027-1 2027-2 2028-1 2028-2 2029-1 2029-2 2029-8 2029-9 |

| This course provides in-depth study of a special topic in computer science not offered elsewhere in the USMA curriculum. Course content will be based on the special expertise of the visiting professor or a senior computer science faculty member.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                             | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 |

| The course provides an introduction to the field of Artificial Intelligence (AI). Cadets will develop an appreciation for the domain of AI and an understanding of the current interest and research in the field. The historical ideas and techniques of AI and the resulting set of concepts will be covered. Classic programs will be covered as well as underlying theory. Topics include a history of computer problem solving, heuristic search techniques, knowledge representation, knowledge engineering, predicate calculus, and expert and/or rule based systems. Advanced topics that may be covered include intelligent agents, genetic algorithms, neural networks, fuzzy logic, robotics, vision, natural language processing, learning, and the programming languages of AI. The course will emphasize the practical application of artificial intelligence to industry and business as well as DoD. |                                                                                                                                                                                                                             | 2026-1 2027-1 2028-1<br>2029-1                         |

The detailed syllabus of this elective will be tailored to the specific project and to qualifications of the cadet. The research or study program will be proposed by the cadet or selected from those proposed by the department. The cadet will formalize a proposal, design a viable research plan, and conduct research under the guidance and supervision of a faculty advisor. The Head of the Department will approve cadet projects. Lessons and labs established by consultation between cadet and advisor.

**Lessons:** 0 @ 0 min (0.000 Att/wk)

**Labs:** 0 @ 0 min

**Special Requirements:**

At least 3.0 average in CS courses normally required. Grades based largely on research paper/presentation to faculty. Participation in Eastern Collegiate Science Conference/publication of research are options.

| This course is designed to familiarize the cadet with advanced techniques for independent research in computer science. The course will normally require research, development, and implementation of a novel idea or concept. An oral presentation and a written project report will be completed under the supervision of a USMA faculty member who serves as project advisor. The course requires three full weeks of study, completed in conjunction with the Academic Individual Advanced Development program. Scope, depth, and material covered will meet the requirements of a three-credit course in computer science. |                                    | No Course Offerings                                           |

| <p>This course is designed to familiarize the cadet with advanced techniques for independent research in computer science. No Course Offerings</p> <p>The course will normally require research, development, and implementation of a novel idea or concept. An oral presentation and a written project report will be completed under the supervision of a USMA faculty member who serves as project advisor. The course requires three weeks of study, completed in conjunction with the Academic Individual Advanced Development program. Scope, depth, and material covered will be equivalent to one credit of course work in computer science.</p>                                                                                                                                                             |                                         |                                                    |

| <p>This course provides an introduction to the fundamentals of computing and Cyberspace. The course presents basic program design and construction techniques, with consideration given to principles of software engineering. Problem solving using computing devices as tools is a central theme throughout the course as students employ various design methodologies. Students utilize an integrated development environment and contemporary application software. Emphasis is placed on critical thinking, creativity, and learning how to learn. Students are introduced to legal, ethical, professional, and security issues and the challenges, opportunities, and attributes of the cyber domain.</p>                                                                                                      |                                         |                                                    |

| <p>This course provides an introduction to the fundamentals of computing and Cyberspace. The course presents basic program design and construction techniques, with consideration given to principles of software engineering. Problem solving using computing devices as tools is a central theme throughout the course as students employ various design methodologies. Students utilize an integrated development environment and contemporary application software. Emphasis is placed on critical thinking, creativity, and learning how to learn. Students are introduced to legal, ethical, professional, and security issues and the challenges, opportunities, and attributes of the cyber domain. *This is a pilot course and must undergo review by the Curriculum Committee NLT AY26-2 to continue.*</p> |                                         |                                                    |

| <p>This course provides a more advanced opportunity to explore the fundamentals of computing and Cyberspace. The course presents basic program design and construction techniques, with consideration given to principles of software engineering. Problem solving using computing devices as tools is a central theme throughout the course as students employ various design methodologies. Students utilize an integrated development environment and contemporary application software. Emphasis is placed on critical thinking, creativity, and learning how to learn. Students are introduced to legal, ethical, professional, and security issues and the challenges, opportunities, and attributes of the cyber domain.</p>                                                                                  |                                         |                                                    |

| Cadets learn fundamental computing concepts that will allow them to design, build and test small to medium programs using a high-level programming language. Key concepts include applying appropriate aspects of a structured problem solving process, applying a standardized design notation such as the Unified Modeling Language (UML) to communicate their design, and iteratively testing their program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                       | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2027-8<br>2028-1 2028-2 2028-8<br>2029-1 2029-2 2029-8<br>2029-9                                                        |

| This course examines the critical role of emerging technologies in modern warfare, with particular emphasis on cyber and computing capabilities. Through case studies, students investigate how technological innovations are integrated onto the battlefield by analyzing historical precedents, evaluating contemporary practices, and exploring future trends. Each case study is complemented by experiential learning activities that reinforce and illustrate central themes including the transient nature of technological superiority, the increasing accessibility of technological advantage through human-machine teaming, and the importance of early exploration, risk-aware adoption, and innovation driven from both the top down and bottom up. Core topics, such as cyberspace operations, electronic warfare, information operations, robotics, and artificial intelligence, are covered with a focus on their operational advantages, risks, and strategic implications. The course also explores emerging technologies more broadly, presents frameworks for assessing their impacts, and introduces the Army's modernization and acquisition processes. By the end of the course, students develop analytical skills, strategic awareness, and the confidence to critically assess and apply technology in support of military operations. *The AY26-1 offering is a pilot that must be reviewed by the Curriculum Committee NLT AY26-2 to continue.* |                                                                                                                       | 2026-1 2026-2 2026-3<br>2026-4 2026-5 2026-9<br>2027-1 2027-2 2027-4<br>2027-5 2028-1 2028-2<br>2028-4 2029-1 2029-2<br>2029-3 2029-4 2029-5<br>2029-8 2029-9 |

| <p>This course provides a comprehensive overview of the critical role of innovative technologies in modern warfare, with a particular focus on cyber and computing capabilities. Students will explore pathways for integrating new technologies onto the battlefield, examining historical precedents and current practices. Key topics include cyber operations, electronic warfare, information operations, robotics, and artificial intelligence -- with an emphasis on assessing their advantages, risks, and implications for future conflicts. Additionally, the course covers emerging technologies, technology evaluation, and the Army's modernization and acquisition processes. By the end of this course, students will possess analytical skills, strategic insights, and a critical mindset that enables them to evaluate and leverage cutting-edge technologies in military operations. **This is a pilot course and must go through the CC for approval NLT AY25-2 to continue.**</p> |                                                                                                                                       | No Course Offerings                                                                   |

| <p>This course provides cadets with an introduction to computer networks by breaking the subject into comprehensible parts and building a survey of the state of the art. The goal of the course is to provide each cadet with basic concepts necessary to understand the design and operation of computer networks. Taking a layered approach, it examines the Internet with an emphasis on the TCP/IP protocol suite. Additionally, basic principles including multiplexing, switching, flow control, and error control are covered. Internetworking and its application to both local and wide area networks are also investigated. The course offers an understanding of the current status and future directions of technology and how technology relates to standards.</p>                                                                                                                                                                                                                       |                                                                                                                                       | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2028-1<br>2028-2 2029-1 2029-2<br>2029-8 2029-9 |

| <p>Provides a more in-depth study of computing for cadets who have demonstrated ability beyond the level of CY305. The course covers material presented in CY305 at an accelerated pace to provide cadets additional opportunities for application and hands-on experience with cyber principles and concepts such as encryption and machine learning, with less emphasis on networking.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                       | 2026-1 2027-1 2028-1<br>2029-1                                                        |

| <p>This course provides a practical introduction to user interface development and usability engineering of interactive applications. The disciplines of Human-Computer Interaction (HCI), Cybersecurity, and Software Engineering guide these endeavors. Major emphasis is on the principles and techniques for human-centered, secure design and implementation of graphical user interfaces (GUIs) within a software development lifecycle. Cadets will extend their knowledge of programming in a high-level language by learning how to use an interface builder to create a fully functional GUI. Cadets will learn and practice human-centered problem analysis techniques and testing methodologies to ensure that their interfaces are usable and secure. A hypothetico-deductive approach to design is emphasized throughout their development efforts. Fundamentals taught in this course will prepare cadets for more advanced software development, development of physical devices, or a deeper theoretical look at HCI topics.</p> |                                      | 2026-2 2027-2 2028-2<br>2029-2                           |

| <p>This course applies fundamental programming skills to automate interactions with a computer, a local operating system, or the Internet and so use and manage resources and services. Examples of the resources and services that the programming in this course will address include file systems, web servers, mail servers, database servers, image and audio files, compressed and encrypted files and files used in common office environments (documents, presentations, spreadsheets).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                      | No Course Offerings                                      |

| <p>This course grounds cadets in algorithms and key topics in the theory of computation, with a focus on how key theoretical techniques help the cyber professional discern what is and is not feasible in cyberspace. Topics include analysis of algorithms, how to use algorithmic complexities to choose between algorithms, algorithmic approaches, and an introduction to formal languages, automata, computational theory, decidability, and the Chomsky hierarchy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                      | 2026-2 2027-2 2028-2<br>2029-2                           |

| <p>The student pursues study of a topic in Cyber Science on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the student based on resources and in consultation with a faculty advisor. The cadet will formalize a proposal, design a viable research plan, or conduct research under the guidance and supervision of a faculty member. In consultation with a faculty advisor, the student will write a proposal that outlines the scope of the project, includes graded requirements, and establishes lesson and lab meetings, as appropriate. Proposals must be approved by the Department Head.</p>                                                                                                                                                                                                                                                                                                                                           |                                      | 2026-2 2027-1 2027-2<br>2028-1 2028-2 2029-1<br>2029-2   |

| The student pursues study of a topic in Cyber Science on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the student based on resources and in consultation with a faculty advisor. The cadet will formalize a proposal, design a viable research plan, or conduct research under the guidance and supervision of a faculty member. In consultation with a faculty advisor, the student will write a proposal that outlines the scope of the project, includes graded requirements, and establishes lesson and lab meetings, as appropriate. Proposals must be approved by the Department Head. |                                                                                                                          | 2029-2                                                 |

| The student pursues study of a topic in Cyber Science on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the student based on resources and in consultation with a faculty advisor. The cadet will formalize a proposal, design a viable research plan, or conduct research under the guidance and supervision of a faculty member. In consultation with a faculty advisor, the student will write a proposal that outlines the scope of the project, includes graded requirements, and establishes lesson and lab meetings, as appropriate. Proposals must be approved by the Department Head. |                                                                                                                          | 2027-2 2028-2 2029-2                                   |

| The student pursues study of a topic in Cyber Science on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the student based on resources and in consultation with a faculty advisor. The cadet will formalize a proposal, design a viable research plan, or conduct research under the guidance and supervision of a faculty member. In consultation with a faculty advisor, the student will write a proposal that outlines the scope of the project, includes graded requirements, and establishes lesson and lab meetings, as appropriate. Proposals must be approved by the Department Head. |                                                                                                                          | 2026-1 2026-8 2027-2<br>2028-2 2029-1 2029-2                         |

| This course gives cadets the ability to apply adversarial thinking in order to anticipate and defend resources. The course maintains a breadth of cyber topics, including secure programing best practices, system administration, and network scanning. Cadets will learn how to secure computer systems, patch vulnerabilities, and detect and remove malware from computer systems. **This is a provisionally approved course for the updated Cyber Science major, CYS1. It will need full approval by the Curriculum Committee in AY26-2 to continue. It may be used as a pilot in AY26-1.**                                                                                                                                                                                                                                                                |                                           | 2026-1 2027-1 2028-1                                                                                   |

| This course provides a solid background in cloud computing principles and applications. It includes understanding cloud computing fundamentals, cloud architecture considerations, cloud technology service selection, and cloud computing security controls. The course does not focus on vendor specific cloud solutions like Amazon Web Services or Microsoft Azure, but instead focuses on the tools and management of cloud computing systems that could be deployed on these vendor specific platforms. Cadets will examine various cloud services and recommend solutions to problems utilizing cloud services. They will also learn how to take existing distributed applications and configure and deploy them to cloud environments. The culmination of the course is a group project that solves a problem utilizing cloud services and technologies |                                           | 2026-2 2027-2 2028-2<br>2029-2                                                                         |

| The focus for this course is to design, build and test secure networked computer systems. Topics covered include operating system and network security, secure network architecture, and offensive and defensive information operations. Practical exercises that give students hands-on experience with current network security tools and techniques complement a series of laboratory exercises that have small groups of cadets secure their own small network. In a culminating exercise, cadets design, build and test defensive measures to protect a production network from intrusions.                                                                                                                                                                                                                                                                |                                           | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2027-9<br>2028-1 2028-2 2028-9<br>2029-1 2029-2 2029-8<br>2029-9 |

| This course addresses the entire spectrum of information warfare from the political, legal, and ethical aspects to the technology and techniques of cyber attack. The Political Science and Computer Science faculty jointly teach this course. The course covers how digitization has changed the world and the national security environment of the United States. Students also learn how attack and defense are conducted in cyberspace through classroom discussion and hands-on exercises in the IWAR Laboratory. The course culminates with a group project in which cadets are given a real scenario and possible U.S. objectives and then develop and brief an information operation plan.                                                                                                                                                             |                                           | 2026-1 2026-8 2027-1<br>2028-1 2029-1 2029-8                                                           |

**Scope:** 2023-2

**Offerings:**

This course focuses on techniques and considerations related to protecting organizations from cybersecurity threats and managing risk to support successful accomplishment of the organization's mission. Topics include cyber governance and policy, personnel security, security operations, systems administration, cybersecurity planning, procurement, and business continuity.

**Lessons:** 40 @ 55 min (2.500 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** One oral group presentation, one 8-10 page research paper, and two shorter preliminary papers; compensatory time provided.

---

**Scope:** 2026-2

**Offerings:**

This course focuses on conducting cyber attacks using tools, custom software, and scripts. In it, cadets will identify vulnerabilities in target systems, write malware to exploit these vulnerabilities, gain unauthorized access, and achieve actions on the objective all while avoiding detection. \*\*This is a provisionally approved course for the updated Cyber Science major, CYS1, and will need full review by the Curriculum Committee NLT AY27-1 to continue. It may be used as a pilot course in AY26-2.\*\*

**Scope:** 2023-1

**Offerings:**

This course provides in-depth study of a special topic in cyber science not offered elsewhere in the USMA curriculum. Course content will be based on the special expertise of the visiting professor or a senior faculty member.

**Lessons:** 30 @ 75 min (2.000 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** To be determined by the program director

**CY489** **ADV IND STUDY CYBER SCI 3CR** **3.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2022-2

**Offerings:**

The student pursues study of an advanced topic in Cyber Science on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the student based on resources and in consultation with a faculty advisor. The cadet will formalize a proposal, design a viable research plan, and conducts research under the guidance and supervision of a faculty member. In consultation with a faculty advisor, the student will write a proposal that outlines the scope of the project, includes graded requirements, and establishes lesson and lab meetings, as appropriate. Proposals must be approved by the Department Head.

**EE300** **FUNDAMENTALS OF DIGITAL LOGIC** **3.0 Credit Hours**  
(BS=0.0,ET=3.0,MA=0.0)

**Scope:** 2026-1

**Offerings:**

This is a course for non-electrical engineering majors that covers the analysis, design, simulation, and construction of digital logic circuits and systems. The course provides the necessary tools to design digital hardware circuits such as clocks, security devices, and computer hardware. The course begins with the study of number systems and digitization, Boolean algebra, and the design of combinational logic circuits. The first half of the course focuses on combinational logic designs. The second half of the course introduces sequential logic circuits like memory systems, counters, and shift registers. Laboratory work reinforces the course material by requiring cadets to design and implement basic digital circuits. Throughout the course, cadets are challenged to understand and leverage increasing levels of abstraction when designing complex digital systems.

**Scope:** 2026-1

**Offerings:**

This introductory course in electrical engineering for the non-electrical engineering major provides a foundation in basic circuit theory and analysis, power in circuits and electric power systems, analog and digital electronics, and cyber-physical security. Lectures, laboratory work, practical applications, and classroom demonstrations emphasize and illustrate the fundamental theories and concepts presented in the course. Engineering design is reflected in laboratory work and a design project.

|--------------|-------------------------------|----------------------------------------------------------|

---

**Scope:** 2009-1

**Offerings:**

This first course in electrical engineering provides a solid introduction to electric circuit theory. Fundamental principles and network theorems are developed using DC resistive circuits. The complete responses of RC, RL, and RLC circuits are obtained using classical and Laplace-transform techniques to solve the related differential equations. Electrical system transfer functions, time-domain and frequency-domain relationships, stability, frequency response, steady-state AC analysis, and power are also studied. Laboratory work, practical applications, and classroom demonstrations emphasize and illustrate the fundamentals presented in the course.

| This is a course for non-electrical engineering majors that provides a foundation in basic circuit theory and analysis, power in circuits, analog electronics, and microcontrollers. Lectures, laboratory work, classroom demonstrations and discussions showing practical applications illustrate the fundamental theories and concepts presented in the course. Students apply their foundational knowledge toward progressively complex integrations of circuits and sensors to model practical robotic systems. Engineering science is reflected in laboratory work. |        | 2026-1 2026-2 2027-1<br>2027-2 2028-2 2029-2 |

| <b>Scope:</b> | 2026-1 | <b>Offerings:</b> |
|---------------|--------|-------------------|

This course introduces the principles and practices of digital system design, from foundational logic circuits to basic processor architecture. Students begin by exploring binary and hexadecimal number systems, Boolean algebra, and their application in designing combinational and sequential circuits. Design techniques such as Karnaugh maps and finite state machines are applied to implement circuits using medium-scale integration (MSI) devices and field-programmable gate arrays (FPGAs). Students also learn the basics of the Very High-Speed Integrated Circuit Hardware Description Language (VHDL) for simulating digital systems and programming hardware. In the final block, the course transitions to microprocessor fundamentals, covering processor components, instruction execution, and machine-level programming, providing a bridge between digital logic design and computer architecture.

**EE362****INTRODUCTION TO ELECTRONICS**
**3.5 Credit Hours**  
**(BS=0.0,ET=3.5,MA=0.0)**
**Scope:**

2014-1

**Offerings:**

This course continues cadet education in electrical engineering through the study of basic electronic devices and circuits. It begins with an introduction to semiconductor physics. It then covers the operation of the pn-junction diode and the metal-oxide semiconductor field-effect transistor (MOSFET) in DC, large-signal, and small-signal regimes. The course emphasizes single-stage amplifier design. The course concludes with an introduction to bipolar junction transistors (BJT) and the design, analysis, simulation, building, and testing of a two-stage audio amplifier. Six laboratory exercises and computer-aided design and analysis using modern circuit simulation software supplement the lectures with practical circuit analysis, design, construction and testing.

**Lessons:** 40 @ 55 min (2.500 Att/wk)      **Labs:** 7 @ 120 min

**Special Requirements:** All cadets design, build and test a multistage audio amplifier (0.5 design credits).

**Prerequisite(s):** EE302

**Scope:** 2020-1 **Offerings:**

This course provides an introduction to computer organization and design. It builds on digital logic theory and devices to develop more complex systems. Graded assignments emphasize understanding and applying the basics of computer system organization, design, and operation. Students analyze contemporary computer organization by examining the operation of a program at the register level. Students learn, simulate, and program a modern processor. Assembly language programming provides system function control that bridges the gap between hardware and software. C programming demonstrates a high-level language greatly utilized in computing. The course introduces topics including RISC architectures, arithmetic processing, input/output, memory design, and parallel computing.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Projects using Assembly Language and C.

**Prerequisite(s):** EE360

---

**Scope:** 2026-1 **Offerings:**

This course provides a study of the fundamentals in three areas of electric power engineering: electromechanical energy conversion, electric power systems, and power electronics. Steady-state behavior in single-phase and balanced three-phase power circuits is emphasized. Transformers, AC & DC machines, transmission lines, power systems, power electronic devices, and electrical safety are studied. Laboratory exercises demonstrate the electrical, mechanical, and physical characteristics of several of the systems studied.

**Lessons:** 36 @ 55 min (2.500 Att/wk)      **Labs:** 4 @ 120 min

**Special Requirements:** Computer-aided analysis of a small power system is included.

---

**Scope:** 2026-1 **Offerings:**

This course teaches students how to employ microcontrollers in the designs of embedded systems through applied exercises. Microcontrollers are programmed at the register level using the C language. Students conduct a detailed study of common microcontroller peripherals with an emphasis on their application to real-time control design. Cadets are exposed to addressing, serial and parallel input and output, timing, interrupts, A-to-D and D-to-A conversion, universal asynchronous receiver transmitter protocol, inter-integrated circuit protocol, serial peripheral interface protocol, and low power design. Throughout the course, students practice top-down and state machine design for moderately complex digital systems.

**Lessons:** 24 @ 75 min (1.600 Att/wk)      **Labs:** 7 @ 120 min

**Special Requirements:** None

| <p>This course teaches students how to employ microcontrollers and single-board computers in the designs of embedded systems through applied exercises. Microcontrollers are programmed at the register level using the C language. Students conduct a detailed study of common microcontroller peripherals with an emphasis on their application to real-time control design. Cadets are exposed to addressing, serial and parallel input and output, timing, interrupts, A-to-D and D-to-A conversion. Subsequently, students study single-board computers and apply them in more complex designs. The basics of operating systems are taught using Linux and Robot Operating Systems. Emphasis is placed on linking peripherals to the processor and using multiprocessing. Throughout the course, students practice top-down and state machine design for moderately complex digital systems.</p>                                                                                                                                                                                                                                                                                                                          |                                                                                                                                  | No Course Offerings                                           |

| <p>This course provides a general study of linear system theory and signal representation techniques as preparation for continued study in communications, control, and electronic systems. Topics include the resolution of continuous time signals and discrete time sequences into their images as frequency functions using Fourier series and transforms. The study includes singularity functions, convolution, convergence properties, and transform properties. The Laplace transform and its inverse provide a method for determining the system function for systems described by differential equations, while the z-transform and its inverse provide a method of analysis for difference equations. The course includes a brief study of communication system principles to include sampling and a study of analog and digital (both finite and infinite impulse response) filter design. Laboratory exercises emphasize programming with software tools to generate, analyze, and process signals. Students gain experience developing scripts and algorithms to implement signal processing techniques, with opportunities to apply AI-assisted methods and receive instructor guidance in problem solving.</p> |                                                                                                                                  | 2026-1 2026-8 2027-1<br>2028-1 2029-1 2029-8                  |

| <p>This course is an introduction to electromagnetic fields, which are the foundation of electrical engineering. The course begins with transmission line analysis using circuit models and reviews the mathematical tools (vector algebra and calculus) that are used to describe electromagnetic phenomena. Maxwell's equations are solved to describe time-harmonic fields under various boundary conditions and at interfaces between dissimilar media. Additional topics include the applications of electromagnetic field theory to transmission lines, antennas and waveguides, and the role of electromagnetics in science, technology and society. Laboratory periods provide opportunities for instructor-assisted problem solving, technology demonstrations, and an experimental lab with an associated lab report. Finally, students complete a computer aided design project on transmission lines.</p>                                                                                                                                                                                                                                                                                                          |                                                                                                                                  | 2026-2 2026-8 2027-2<br>2028-2 2029-1 2029-2<br>2029-8 2029-9 |

| The student pursues study of a topic in Electrical Engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the student based on resources and in consultation with a faculty advisor. The cadet will formalize a proposal, design a viable research plan, or conduct research under the guidance and supervision of a faculty member. In consultation with a faculty advisor, the student will write a proposal that outlines the scope of the project, includes graded requirements, and establishes lesson and lab meetings, as appropriate. Proposals must be approved by the Department Head. |                                                                                                                                                                                                                                                    | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| The student pursues study of a topic in Electrical Engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the student based on resources and in consultation with a faculty advisor. The cadet will formalize a proposal, design a viable research plan, or conduct research under the guidance and supervision of a faculty member. In consultation with a faculty advisor, the student will write a proposal that outlines the scope of the project, includes graded requirements, and establishes lesson and lab meetings, as appropriate. Proposals must be approved by the Department Head. |        | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

|---------------|--------|-------------------|
| <b>Scope:</b> | 2022-2 | <b>Offerings:</b> |
|---------------|--------|-------------------|

The student pursues study of a topic in Electrical Engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the student based on resources and in consultation with a faculty advisor. The cadet will formalize a proposal, design a viable research plan, or conduct research under the guidance and supervision of a faculty member. In consultation with a faculty advisor, the student will write a proposal that outlines the scope of the project, includes graded requirements, and establishes lesson and lab meetings, as appropriate. Proposals must be approved by the Department Head.

**Scope:**

2019-2

**Offerings:**

This course addresses the concerns of professional electrical engineers such as engineering ethics, economics, licensing, manufacturability, sustainability, reliability, safety, and design methodologies. It includes Fundamentals of Engineering Exam preparation and supports the USMA writing program as a Writing in the Major course. The course includes all first class cadets majoring in electrical engineering. Guest lecturers from military, industrial, and academic communities will present some of the material.

| This is the capstone course of a three course engineering sequence designed to introduce students to the fundamentals of robotics engineering. Students apply these fundamentals, along with foundations of digital logic and circuit design acquired in the sequence, to interface various sensors and actuators with a simple microprocessor using experiments that demonstrate some basic applications of a simple robot. Finally, students apply the engineering design process to guide their design of a robot from a moderately complex state machine to a fully integrated robotic system capable of performing some practice military robotic applications.                                                                             |                                                                                                                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course focuses on the design, simulation, building, and testing of a wide variety of application-oriented circuits based upon the bipolar junction transistor (BJT) and operational amplifier (OPAMP). Applications of the BJT include current sources, active loads, differential amplifiers, and power amplifiers. OPAMP applications include mathematical operations and active filters. Themes common to both the BJT and OPAMP are frequency response and feedback. In addition, printed circuit board design is introduced through a skill-builder power supply kit. The classroom material is supplemented with seven labs, computer-aided simulations using modern circuit simulation software, and a comprehensive design project. |                                                                                                                                | 2026-2 2027-2 2028-2<br>2029-2                                |

| This course examines modern digital communications systems. The study of digital communications systems includes waveform sampling, time multiplexing, line coding, digital modulation, and clock recovery techniques. Time and frequency domain analysis are the basis for study of bandwidth considerations, filtering, and channel and communication system modeling. Mathematics topics include Fourier analysis, probability, information theory, correlation, random variables, and entropy. Digital communication resilience is explored through channel capacity, line coding, and error correcting codes. Four labs are utilized to put topics into practice.                                                                           |                                                                                                                                | 2026-2 2026-8 2027-2<br>2028-2 2029-2                         |
| <b>Lessons:</b> 37 @ 55 min (2.500 Att/wk)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>Labs:</b> 3 @ 120 min                                                                                                       |                                                               |

| This course unlocks the secrets of fiber optics, the technology powering the modern internet and telecommunications. Students will master the fundamentals of lightwave transmission through optical fibers, including modal fields, attenuation, and dispersion. Additionally, students will delve into key communication components like transmitters, modulators, and receivers. Students will gain hands-on experience with software tools and measurement equipment to characterize fiber and device properties. The course culminates with students designing, building, and characterizing a fiber optic communications link.                                                                                                             |                                                                                                                                | 2026-1 2027-1 2028-1<br>2029-1                                |

---

**Scope:** 2014-2

**Offerings:**

This course provides an introduction to wireless systems engineering with applications to voice and data networks. Description of well known systems such as cell phones, pagers, and wireless LAN's is presented along with the design considerations for deployment of wireless networks. Wireless radio channel modeling along with common impairments such as multipath fading are introduced and modulation techniques well suited to the wireless applications are presented. Receivers for the various modulation schemes are analyzed in terms of performance and the trade-offs offered by source and channel coding are presented. Multiple access techniques used in wireless applications are introduced and the design of networks described. The course concludes with an analysis and description of deployed systems along with their standards and services provided.

|--------------|------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

This course introduces the fundamental principles of photonics to equip students with the skills to design, build, and test their own free-space optical communication system. Students gain hands-on experience with key photonic devices like transmitters, modulators, lenses, waveguides, gratings, and detectors. The course weaves in key ideas from electromagnetics and quantum mechanics throughout the course.

|--------------|---------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-2

**Offerings:**

This course introduces students to the fundamentals of robotics and exposes them to the best practices followed by the robotics community (academic and research). The lesson content is broadly organized into two categories - the theory underpinning robots and exploration through practical implementation. Some of the concepts taught are sensor fusion, robot manipulation, state estimation using Kalman filters, and the use of an open-source middleware. Students will become familiar with the command line tools, gain practice on software programming, and learn to interface with simple electronics through single board computers. \*The ET credits are proposed and will be validated through Academy processes.

| <p>This course introduces students to the fundamentals of robotics and exposes them to the best practices followed by the robotics community (academic and research). The lesson content is broadly organized into two categories - the theory underpinning robots and exploration through practical implementation. Some of the concepts taught are sensor fusion, robot manipulation, state estimation using Kalman filters, and the use of an open-source middleware. Students will become familiar with the command line tools, gain practice on software programming, and learn to interface with simple electronics through single board computers. **This is a pilot course and will need CC review NLT AY27. ET credits will be assigned after ABET PEV review.**</p>                                                                                                                               |                                                                                                         | 2029-2                                     |

| <p>The course covers device physics, operating principles and applications of diodes, bipolar junction transistors, and field effect transistors (FET). It begins with basic properties of crystalline solids, energy diagrams, and thermal physics. P-N junction diodes are the first semiconductor device explored with further study into metal oxide semiconductor (MOS) capacitor and MOSFET based devices. The course also covers the layout of complementary metal oxide semiconductor (CMOS) gates on an integrated circuit chip. Throughout the course, a number of general electronic devices are introduced including digital memories, charge coupled devices, solar cells, photodiodes, light emitting diodes and lasers. The laboratories are focused on P-N junction device parameter extraction, CMOS digital circuit characterizations, and the application of optoelectronic devices.</p> |                                                                                                         | 2026-2 2027-2 2028-2<br>2029-2             |

| <p>This course teaches students how to employ microcontrollers and single-board computers in the designs of embedded systems through applied exercises. Microcontrollers are programmed at the register level using the C language. Students conduct a detailed study of common microcontroller peripherals with an emphasis on their application to real-time control design. Cadets are exposed to addressing, serial and parallel input and output, timing, interrupts, A-to-D and D-to-A conversion. Subsequently, students study single-board computers and apply them in more complex designs. The basics of operating systems are taught using Linux and Robot Operating Systems. Emphasis is placed on linking peripherals to the processor and using multiprocessing. Throughout the course, students practice top-down and state machine design for moderately complex digital systems.</p>       |                                                                                                         | 2029-2                                     |

**Scope:** 1974-1

**Offerings:**

Course requirements will be tailored to the needs and qualifications of the individual cadet. The course will normally involve a project requiring research, experimentation, and the submission of a report under the guidance of a departmental advisor. Alternatively, study may take the form of a tutorial course covering material not available in the regular elective course offerings.

**Scope:** 1990-4

**Offerings:**

This course is designed to familiarize the cadet with advanced techniques for independent research in electrical engineering. The course will normally require research, development, and experimental implementation of a novel idea or concept. An oral presentation and a written project report will be completed under the supervision of a usma faculty member who serves as project advisor. The course requires three full weeks of study, completed in conjunction with the academic individual advanced development program. Scope, depth, and material covered will meet the requirements of a three-credit course in electrical engineering.

**XE383**

**ELECTROMAGNETIC WAVES**

**3.0 Credit Hours**  
(BS=3.0,ET=0.0,MA=0.0)

**Scope:**

2018-2

**Offerings:**

This course is an introduction to electromagnetic waves, which are the foundation of electrical engineering and applied physics. The course begins with transmission line analysis using circuit models and reviews the mathematical tools (vector algebra and calculus) that are used to describe electromagnetic phenomena. Maxwell's equations are solved to describe time-harmonic fields under various boundary conditions and at interfaces between dissimilar media. Additional topics include the applications of electromagnetic wave theory to transmission lines, antennas and waveguides, as well as the role of electromagnetics in science, technology and society. Laboratory exercises are conducted to experimentally characterize transmission lines and antennas, and to provide instructor-assisted problem solving sessions. Additionally, Cadets complete a computer project on finding the numerical solutions to Maxwell's equations.

**INTEGRATIVE SYSTEM DESIGN I**

**3.5 Credit Hours**  
(BS=0.0,ET=3.5,MA=0.0)

**Scope:**

2020-1

**Offerings:**

This course is the first part of a two-semester team-based capstone design experience in electrical engineering, computer science and information technology. It provides an integrative experience, presenting each cadet team with a professionally relevant, open-ended situation including professional, ethical, social, security, legal, economic, and political dimensions, where an engineering approach has strong potential to produce benefits. Under the guidance of a faculty advisor for each project team, cadets develop client-focused products, applying the principles of design and implementation to effect an optimal outcome for the circumstances presented to the team by creating a product or service that meets requirements and constraints negotiated with the client.

|---------------|--------|-------------------|
| <b>Scope:</b> | 2019-2 | <b>Offerings:</b> |
|---------------|--------|-------------------|

This course is team-based capstone design experience in electrical engineering, computer science and information technology. It provides an integrative experience, presenting each cadet team with a professionally relevant, open-ended situation including professional, ethical, social, security, legal, economic, and political dimensions, where an engineering approach has strong potential to produce benefits. Under the guidance of a faculty advisor for each project team, cadets develop client-focused products, applying the principles of design and implementation to effect an optimal outcome for the circumstances presented to the team by creating a product or service that meets requirements and constraints negotiated with the client.

**Lessons:** 30 @ 150 min (2.000 Att/wk)    **Labs:** 0 @ 120 min

**Special Requirements:** None

**Prerequisite(s):** XE401

| <b>Scope:</b> | 2015-1 | <b>Offerings:</b> |
|---------------|--------|-------------------|

This course provides a study of the fundamentals of alternative energy generation, storage, integration and efficient use. Solar power (both solar thermal and photovoltaic), wind power, hydro power, fuel cells and other sources of energy are covered. Focus is placed on energy conversion, modeling alternative energy sources, and integration of these sources into the power grid. The technical, economic, and global challenges associated with these alternative energies is covered in depth.

|---------------|--------|-------------------|
| <b>Scope:</b> | 2025-1 | <b>Offerings:</b> |
|---------------|--------|-------------------|

This course covers dynamic modeling and control of linear systems. The course provides an overview of classical control theory as the foundation for control applications in electrical, mechanical, and aeronautical systems. Topics here include system modeling using Laplace transform, frequency domain, and state variable methods. Mathematical models are developed for electrical, mechanical, aeronautical, chemical and other physical control systems. Control systems analysis and design techniques are studied within the context of how each system is physically controlled in practice. Laboratory exercises include feedback design and system identification. Computer design exercises include dynamic modeling and control of various engineering systems.

**Lessons:** 36 @ 55 min (2.500 Att/wk)    **Labs:** 4 @ 120 min

**Special Requirements:** Computer interactive exercises.

| <p>The course begins by developing the background understanding of what disruptive technology is and a historical context about successes and failures of social, cultural, and religious acceptance of technological innovation. To develop this framework, students read several texts underlying the innovator's dilemma, how scientific revolutions are structured, and cultural distinctions found between the sciences and humanities. For each class meeting, students read current scientific and technical literature and come prepared to discuss current events related to technological innovation. Each student researches potential disruptive technologies and prepares a compelling argument of why the specific technologies are disruptive so they can defend their choice and rationale. Cadets also interact with national level innovators throughout academia, industry, and government.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                      | 2026-1 2027-1 2028-1                       |

| <p>The purpose of XE497, Critical Scientific Reasoning, is to improve the students' ability to analyze complex problems in a variety of applied physical science applications using mathematical, scientific, and engineering principles and clearly articulate their analysis and results verbally and in writing. The process of pursuing this goal will make cadets better officers, scholars, and citizens. Several methods will be applied to assist in the pursuit of these goals. Fundamental scientific laws, principles, and theorems and their application to scientific and engineering problem solving will be reviewed. Breadth across a variety of scientific and engineering disciplines will be achieved by studying and discussing current research activities from a variety of fields as well as examining the limitations to scientific advancement in each field. The course will draw from several disciplines including Biology, Chemistry, Civil Engineering, Computing Sciences, Electrical Engineering, Mathematical Science, Mechanical Engineering and Physics. In order to take advantage of the diverse skills of the USMA faculty and selected experts from outside USMA, some classes will be led by guest instructors, each of whom will recommend readings in support of his or her topic.</p> |                                                                      | No Course Offerings                        |

| This foundational course will provide cadets with the basic critical reading and writing skills necessary to enter EN101. EN100 aims to develop an awareness of substance, organization, style, and correctness through close, critical reading and by focusing on sentence- and paragraph- level composition. Through daily writing, exercises, and one-on-one conferences, cadets will develop the clear, logical, and grammatically correct writing that will enable them to succeed in EN101.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                             | No Course Offerings                                                  |

| This course aims to develop clear, logical, and grammatically correct expression in written discourse. Augmented by one-on-one writing conferences, daily writing and revision reinforce instruction in the writing process. Organization, substance, style, and correctness in written communication are major concerns of the course, but the course improves other modes of discourse through a process-oriented approach to composition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                             | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2        |

| As an introduction to the study of literature, EN102 provides Cadets the opportunity to refine the skills of oral and written communication practiced in EN101 and to develop certain foundational capacities essential to undergraduate learning and to professional development: critical thinking, close reading, empathy, intellectual agility, emotional intelligence, and creativity. By studying the most challenging and complex employment of language in its most difficult forms, Cadets confront ambiguity and hone their interpretive skills through the judicious interpretation of evidence. Rigorous immersion in literature enables Cadets to increase their command of the English language and to deepen their appreciation for the power and beauty of literary expression. By engaging with major literary genres Cadets cultivate awareness of the central importance of literature to their own culture and to the cultures of various regions and nations across the globe. In their encounter with diverse perspectives Cadets acquire insight into the human condition and begin to grapple with the ethical issues that are the focus of study in PY201. |                             | 2026-2 2026-4 2026-5<br>2027-2 2027-5 2028-2<br>2028-5 2029-2 2029-5 |

This advanced course, into which the Department of English and Philosophy places select cadets, further develops the skills of accomplished writers. This course demands a rigorous and disciplined approach to writing through intensive study and research. It also demands attention to the nuances and persuasiveness of language itself. The course challenges cadets to push their writing beyond basic, first-year academic prose through an emphasis on advanced figures of speech and thought, through a deliberate attention to style, and through an in-depth approach to reading and research. This course expects cadets to think critically and to discover and articulate new ideas and original arguments through persuasive, polished, and mature writing. Finally, this course instills habits of mind that will that will serve cadets throughout their academic and military careers. Because this is an advanced version of EN101, cadets will be placed in EN151 individually, based on the results of a placement exam given in the summer prior to enrollment and by approval of the Head of the Department of English and Philosophy.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Cadets who have credit for EN101 are disqualified from taking EN151.

---

**Scope:** 2025-2

**Offerings:**

EN152 is an advanced version of EN102. The course revolves around the innovative interpretation of literary texts, though it simultaneously acquaints Cadets with strategies for grounding these interpretations in concrete textual evidence and logical inferences. EN152 promotes close, deliberate reading of literary works, presents a comprehensive overview of the terms and tenets of literary studies, and emphasizes how writing, as a process, allows for the further development of one's critical thinking and analytical skills. Finally, EN152 explores the power of literature to promote ethical awareness, cultivate empathy, and emphasize a shared sense of humanity.

|--------------|-------------------------------|----------------------------------------------------------|

---

**Scope:** 2025-1

**Offerings:**

This course provides cadets the methodological tools required to analyze and evaluate primary and secondary sources. Through the study of representative primary sources ranging from the ancient to the postmodern, cadets will learn the critical vocabularies and theoretical contexts necessary for the meaningful study of literature. Attention to the nature and history of literary genres, the historical development of literary criticism, and a variety of theoretical approaches to literature will provide cadets with the foundational knowledge required of an English major.

|--------------|------------------------------------|----------------------------------------------------------|

---

**Scope:** 2025-1

**Offerings:**

This course will focus primarily on the development of the Western literary canon from antiquity to the Early Modern period. Cadets may read from the works of Greek and Roman authors such as Homer, Sophocles, Thucydides, Cicero, Virgil, Ovid, from Medieval authors such as St. Thomas Aquinas, Sir Thomas Malory, Geoffrey Chaucer, and from Early Modern authors such as John Donne, George Herbert, Ben Jonson, and Miguel de Cervantes. Cadets will explore a variety of genres including, but not limited to, epic poetry, histories, drama, and lyric poetry. This course may take its focus from a central theme or idea and trace that theme or idea in the course texts.

| <p>The course will focus on the development of American literature from early contact to the Civil War. Students will read from works by such authors as the Puritans, Jefferson, Lincoln, the Transcendentalists, Dickinson, Whitman, and Melville, as well as literature outside of the New England canon: for example, works by Native Americans, French and Spanish colonizers, and African captives. All works will be considered in the context of cultural and intellectual history. We will consider a broad range of genres and modes of writing, including (but not limited to) colonial theory, ethnography, autobiography, fiction, essays, and poetry. A central concern of the course will be the question of what constitutes American literature.</p> |                                  | 2026-1 2028-1 2030-1                       |

| <p>This course will examine both traditional and nontraditional writings from the Civil War to the present. We will examine post-Civil War literature and the myriad, often contradictory desires--economic, aesthetic, sexual, spiritual, and intellectual--to which it gives expression. The course will provide a framework within which students may examine the literature in an historical context. As does American Literature I, the course stresses the diversity of experience and poetics that characterizes American literature. In addition, students will trace the evolution of important literary movements and philosophical influences, as well as the metamorphosis of certain genres over time.</p>                                               |                                  | 2026-2 2026-8 2028-2<br>2029-8 2030-2      |

| <p>This course is an introduction to the study of British literature, ranging from the Anglo-Saxon period through the eighteenth century. Cadets will encounter representative masterworks from the Old English, Medieval, Renaissance, and Neoclassical periods, exploring in the process the development of literary forms, the culture of the British Isles, and the English language itself. Possible areas of emphasis include narrative and lyric poetry from all these periods, drama from the Middle Ages and Renaissance, the periodical essay from the Neoclassical period, and the emergence of the novel as a distinct form of literature in the eighteenth century.</p>                                                                                  |                                  | 2027-1 2029-1                              |

This course continues the survey initiated in British Literature I by considering major authors and works of the nineteenth and twentieth centuries. Through representative but necessarily selective readings, cadets will trace the development of British literature from the Romantic Period into the Victorian Age and then to the present day. Possible areas of emphasis include poetry of the English Romantics; Victorian poetry and prose, to include the novel; and poetry, short fiction, and drama from the twentieth century. Study will emphasize the relation of the works considered to the cultural history of Great Britain and the British Empire and will attend as well to the wider influence of the British tradition.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** A few essays of moderate length.

**Scope:** 2025-1

**Offerings:**

This course examines literature of the later 20th and the 21st centuries. In addition, it may explore the implications of contemporary information technologies for traditional literary forms, the role of globalization in literary production and reception, or the relation of literature to pressing current issues such as persistent violent conflict, immigration, and climate change. Possible genres and modes of writing include (but are not limited to) short fiction, the novel, poetry, graphic narrative, and electronic literature. A central concern of the course will be the question of what constitutes literature in the contemporary period, a time marked by developing and often differing trends.

**Scope:** 2025-1

**Offerings:**

This course enhances cadets' cultural awareness and refines their disciplinary knowledge and interpretive skills by introducing them to major literary texts from around the globe. As an advanced exercise in comparative study and synthesis, World Literature builds on core courses such as EN302 and foreign language offerings. The prose and poetry of a variety of periods and a range of countries provide contexts for and contrasts to the Anglo-American tradition. In a given semester typical texts could include epics and tragedies of Ancient Greece and Rome, Russian novels, works of medieval Islamic literature, haiku of Japan, Continental European novels of the nineteenth century, or postmodern fiction of South America. This course familiarizes students not only with important literary forms and genres but also with cultural and historical contexts for many of the most pressing issues in our volatile world.

| This course introduces cadets to the theory of interpretation and the practice of literary criticism. Through the study of critics ranging from the ancient to the postmodern, Cadets investigate mimetic, pragmatic, expressive, and objective schools. They also cultivate their own philosophies of interpretation and apply them to primary texts. Readings may focus on aesthetic, cultural, and ethical dimensions of literature, on the role of the critic, and on the proliferation of competing theories during the latter half of the twentieth century. |                                                                | 2027-8 2028-8                                                  |

| Embracing a wide variety of authors, works, periods, traditions, and forms, this course considers the literary genre through which human beings have expressed their most intensely imaginative visions of themselves and the world, and connections between the two. Some consideration of poetics and prosody will complement the cadets' reading of verse that ranges from Japanese haiku through the Shakespearean sonnet to the free-verse creations of modern and contemporary poets.                                      |                                  | 2026-1 2028-1 2030-1                               |

| This course examines film as the major new art form of the twentieth century. Screenings of important films and readings in film theory introduce cadets to the origins, evolution, and cultural influence of cinema. Cadets explore connections between film and the other arts as well as the relationship between art and technology. Topics may include the Hollywood studio system, the transition to sound, world cinema, auteur theory, screenwriting, censorship, and propaganda.                                        |                                  | 2026-2 2028-2 2029-1<br>2029-8 2029-9              |

| In this course the word novel designates any extended fictional narrative, almost always in prose. Cadets will explore the novel of kind or time or both, and, in addition to becoming better readers, will work toward understanding the culturally complex world around them.                                                                                                                                                                                                                                                  |                                  | 2026-2 2028-2 2030-2                               |

| This course surveys significant plays from a variety of periods and traditions to give cadets an appreciation of a genre that exists as both written literature and creative interpretation. Works to be studied range from the classical tragedies of ancient Greece through the great products of the English renaissance to modern efforts by British and American playwrights. Although the primary focus rests upon the Anglo-American tradition, the course will not neglect dramatists from other countries and cultures. |                                  | 2027-1 2029-1                                      |

| This course surveys representative Shakespearean plays, including great tragedies, histories, and comedies. Study stresses the nature of Shakespeare's genius and the relation of his works to the cultures of all ages.                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                       | 2027-2 2029-2 2029-8                               |

| This elective course provides in-depth study of a single author's life and work. The featured author will vary depending on instructor expertise and preference as well as department need. The course allows cadets to gain an insight into the life and work of important authors deeper than the necessarily limited exposure within a survey or genre course affords. The course invites cadets to explore the relationships between biography and creative output, to understand individual works within the context of a writer's larger oeuvre, and to see individual authors as both agents and products of their world. |                                                                                                                       | 2026-2 2028-2 2030-2                               |

| This elective course provides in-depth study of a single author's life and work. The featured author will vary depending on instructor expertise and preference as well as department need. The course allows cadets to gain an insight into the life and work of important authors deeper than the necessarily limited exposure within a survey or genre course affords. The course invites cadets to explore the relationships between biography and creative output, to understand individual works within the context of a writer's larger oeuvre, and to see individual authors as both agents and products of their world. |                                                                                                                       | No Course Offerings                                |

| This course provides cadets with the opportunity for advanced study in the discipline. Through a focus on a particular topic in literature, cadets will build on the foundation established in EN300. They will deepen their mastery of critical methods and theoretical models and grow as scholars by closely examining an author, period, theme, issue, or debate from multiple perspectives. Through intensive study of primary and secondary texts, this course broadens the knowledge base by bridging disciplinary approaches and setting the stage for cadets' continued educational development. |                                                      | 2026-1 2027-1 2028-1<br>2029-1                     |

| This course provides cadets with the opportunity for advanced study in the discipline. Through a focus on a particular topic in literature, cadets will build on the foundation established in EN333. They will deepen their mastery of critical methods and theoretical models and grow as scholars by closely examining an author, period, theme, issue, or debate from multiple perspectives. Through intensive study of primary and secondary texts, this course broadens the knowledge base by bridging disciplinary approaches and setting the stage for cadets' continued educational development. |                                                      | No Course Offerings                                |

| This optional elective offers the cadet an opportunity for in-depth study of an advanced topic in Literature under the mentorship of a senior faculty advisor. The scope and topic of the course are developed in consultation with the faculty advisor and appropriately build upon academic work already completed in the regular Literature electives. Since such a course is beyond normal teaching duties, an agreement to serve as a faculty advisor will be at the discretion of the faculty member. Enrollment is subject to Department approval.                                                                                                                                                                                                                                                                                                                      |                                                                       | 2026-9 2027-2 2028-2<br>2029-2             |

| This optional elective offers the cadet an opportunity for in-depth study of an advanced topic in Literature under the mentorship of a senior faculty advisor. The scope and topic of the course are developed in consultation with the faculty advisor and appropriately build upon academic work already completed in the regular Literature electives. Since such a course is beyond normal teaching duties, an agreement to serve as a faculty advisor will be at the discretion of the faculty member. Enrollment is subject to Department approval.                                                                                                                                                                                                                                                                                                                      |                                                                       | No Course Offerings                        |

| In the standard course sequence, Cadets acquire a basic proficiency in speaking, listening, reading and writing skills in Arabic. Learning activities focus on situations Cadets are likely to encounter in Arabic society. Cadets are taught how to express simple ideas and basic needs, comprehend the language in everyday contexts, and read simplified texts and brief, authentic selections. In addition to speaking, listening and reading skills, Cadets learn how to write sentences, paragraphs and/or short compositions on familiar topics. Through readings and discussions, Cadets are introduced to the cultures and history of the Arabic-speaking world. Cadets acquire a command of basic Arabic vocabulary and gain a general understanding of how the language works, and they become able to apply that knowledge when learning other foreign languages. |                                                                       | 2026-1 2027-1 2028-1<br>2029-1             |

In the intensive intermediate course, cadets develop proficiency in those skills necessary for communicating effectively in Arabic and for pursuing upper-level courses. Cadets develop speaking skills that enable them to engage in conversations on a variety of topics with other class members and with native speakers. Cadets reinforce and expand their language skills by reading, viewing, discussing, and writing about contemporary life, current events, and other cultural and historical topics as presented in selected materials of the Arabic-speaking world. In addition, cadets gain an overview of the profession of arms in Arabic-speaking regions by reading, discussing, and writing about pertinent materials that focus on the mission and history of the military in those countries. Cadets also review the basic rules of Arabic grammar and continue to acquire a corpus of Arabic vocabulary. They will be able to use computer-assisted learning resources to strengthen and maintain their language proficiency. This course serves as a bridge to advanced elective Arabic courses.

**Lessons:** 80 @ 55 min (5.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** None

**Prerequisite(s):** LA204

|--------------|-------------------------------------------|----------------------------------------------------------|

---

**Scope:** 2025-2

**Offerings:**

This course addresses students' specific needs in the development of listening, speaking, reading, and writing skills in Arabic. Cadets expand their active vocabulary, gain greater command of complex grammatical structures, and develop appropriate styles of written and oral communication. Special emphasis is placed on conversational and expository speaking. Cadets increase their oral proficiency through dialogues, role play, group discussions, formal presentations, and simulations of everyday language tasks likely to be encountered in the target region. Guided writing activities develop Cadets' competence in the application of critical language structures. Listening and reading comprehension are strengthened via engagement with film, music, short stories, news reports, and other popular media. Course topics typically focus on regional culture, the military, and society.

**Scope:** 2025-1

**Offerings:**

In this course cadets enhance their reading and writing skills through study and discussion of contemporary Arabic media (e.g. the Internet, television, film, radio, newspapers and magazines), as well as short literary selections. Reading strategies and textual analysis are addressed. Writing tasks develop organization, substance, and style. Graded work typically includes oral and written summaries of authentic texts and short compositions or reaction papers. The course is conducted in Arabic.

---

**Scope:** 2025-2

**Offerings:**

Cadets gain an understanding of the profession of arms in the Arabic-speaking world through lectures and selected reading materials (e.g. journal articles, Internet media, training manuals, biographies, and historical documents). Course content may encompass the mission and role, training, operations, tactics, and organization of the armed forces. Oral proficiency is enhanced through in-class discussion as well as role-plays and simulations focusing on scenarios likely to be encountered while an officer is deployed in an Arabic-speaking region. Media complement instruction. Graded work may include briefings, role-plays, and simulation. The course is conducted in Arabic.

---

**Scope:** 2025-1

**Offerings:**

This course and the following one, LA484, constitute an integrated study of the culture, history, and geography of the Arabic-speaking world. Readings, lectures, discussions, and audio-visual materials encompass this civilization's representative artistic and intellectual accomplishments, its present-day political institutions, economy, and popular culture. In addition, the courses focus on the values and attitudes, the customs and traditions, and the social structures of Arabic people. At the same time, cadets continue to develop greater proficiency in Arabic. Graded work may include giving oral presentations, writing short essays or preparing a term paper. A majority of the work is done in Arabic.

| In this course cadets gain basic competence in the knowledge and comprehension of representative literary works and their relationship to the cultural context of the target society. Selected examples of various literary genres are read, discussed, and analyzed. At the same time, cadets continue to develop greater proficiency in the target language. Video and film presentations supplement readings, where possible. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in the target language.                                                                                                                                                                                                                                                                                        |                              | 2026-1 2027-1 2028-1<br>2029-1                     |

| In this course cadets gain basic competence in the knowledge and comprehension of representative literary works and their relationship to the cultural context of the target society. Selected examples of various literary genres are read, discussed, and analyzed. At the same time, cadets continue to develop greater proficiency in the target language. Video and film presentations supplement readings, where possible. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in the target language.                                                                                                                                                                                                                                                                                        |                              | No Course Offerings                                |

| In this course cadets gain basic competence in the knowledge and comprehension of representative literary works and their relationship to the cultural context of the target society. Selected examples of various literary genres are read, discussed, and analyzed. At the same time, cadets continue to develop greater proficiency in the target language. Video and film presentations supplement readings, where possible. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in the target language.                                                                                                                                                                                                                                                                                        |                              | No Course Offerings                                |

| In the standard course sequence, Cadets acquire a basic proficiency in speaking, listening, reading and writing skills in Chinese. Learning activities focus on situations Cadets are likely to encounter in Chinese society. Cadets are taught how to express simple ideas and basic needs, comprehend the language in everyday contexts, and read simplified texts and brief, authentic selections. In addition to speaking, listening and reading skills, Cadets learn how to write sentences, paragraphs and/or short compositions on familiar topics. Through readings and discussions, Cadets are introduced to the cultures and history of the Chinese-speaking world. Cadets acquire a command of basic Chinese vocabulary and gain a general understanding of how the language works, and they become able to apply that knowledge when learning other foreign languages. |                              | 2026-1 2027-1 2028-1<br>2029-1                     |

| In the intensive intermediate course, cadets develop proficiency in those skills necessary for communicating effectively in Chinese and for pursuing upper-level courses. Cadets develop speaking skills that enable them to engage in conversations on a variety of topics with other class members and with native speakers. Cadets reinforce and expand their language skills by reading, viewing, discussing, and writing about contemporary life, current events, and other cultural and historical topics as presented in selected materials of the Chinese-speaking world. In addition, cadets gain an overview of the profession of arms in Chinese-speaking regions by reading, discussing, and writing about pertinent materials that focus on the mission and history of the military in those countries. Cadets also review the basic rules of Chinese grammar and continue to acquire a corpus of Chinese vocabulary. They will be able to use computer-assisted learning resources to strengthen and maintain their language proficiency. This course serves as a bridge to advanced elective Chinese courses. |                                | 2026-1 2027-1 2027-8<br>2028-1 2028-8 2029-1 |

| This course addresses students' specific needs in the development of listening, speaking, reading, and writing skills in Chinese. Cadets expand their active vocabulary, gain greater command of complex grammatical structures, and develop appropriate styles of written and oral communication. Special emphasis is placed on conversational and expository speaking. Cadets increase their oral proficiency through dialogues, role play, group discussions, formal presentations, and simulations of everyday language tasks likely to be encountered in the target region. Guided writing activities develop Cadets' competence in the application of critical language structures. Listening and reading comprehension are strengthened via engagement with film, music, short stories, news reports, and other popular media. Course topics typically focus on regional culture, the military, and society.                                                                                                                                                                                                          |                                | 2026-2 2027-2 2028-2<br>2029-2               |

**Scope:** 2025-1

**Offerings:**

In this course cadets enhance their reading and writing skills through study and discussion of contemporary Chinese media (e.g. the Internet, television, film, radio, newspapers and magazines), as well as short literary selections. Reading strategies and textual analysis are addressed. Writing tasks develop organization, substance, and style. Graded work typically includes oral and written summaries of authentic texts and short compositions or reaction papers. The course is conducted in Chinese.

---

**Scope:** 2025-2

**Offerings:**

Cadets gain an understanding of the profession of arms in the Chinese-speaking world through lectures and selected reading materials (e.g. journal articles, Internet media, training manuals, biographies, and historical documents). Course content may encompass the mission and role, training, operations, tactics, and organization of the armed forces. Oral proficiency is enhanced through in-class discussion as well as role-plays and simulations focusing on scenarios likely to be encountered while an officer is deployed in a Chinese-speaking region. Media complement instruction. Graded work may include briefings, role-plays, and simulation. The course is conducted in Chinese.

---

**Scope:** 2025-1

**Offerings:**

This course and the following one, LC484, constitute an integrated study of the culture, history, and geography of the Chinese-speaking world. Readings, lectures, discussions, and audio-visual materials encompass this civilization's representative artistic and intellectual accomplishments, its present-day political institutions, economy, and popular culture. In addition, the courses focus on the values and attitudes, the customs and traditions, and the social structures of Chinese-speaking people. At the same time, cadets continue to develop greater language proficiency. Graded work may include giving oral presentations, writing short essays or preparing a term paper. A majority of the work is done in Chinese.

| In this course cadets gain basic competence in the knowledge and comprehension of representative literary works and their relationship to the cultural context of the target society. Selected examples of various literary genres are read, discussed, and analyzed. At the same time, cadets continue to develop greater proficiency in the target language. Video and film presentations supplement readings, where possible. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in the target language. |                                    | 2026-1 2027-1 2028-1 2029-1                       |

| This course seeks to enhance the language proficiency of non-native English speakers within the cognitively rigorous demands of a military-academic environment. While essentially a writing course, significant rhetorical, oratorical, and analytical skills are developed through extensive reading and systematic analysis of culturally relevant texts. At the same time, research and documentation skills are stressed to develop positive control over linguistic and professional conventions expected of Cadets in subsequent or concurrent courses at the Academy.               |                                    | 2026-1 2027-1 2028-1 2029-1                       |

| In the standard course sequence, Cadets acquire a basic proficiency in speaking, listening, reading, and writing skills in French. Learning activities focus on situations Cadets are likely to encounter in French society. Cadets are taught how to express simple ideas and basic needs, comprehend the language in everyday contexts, and read simplified texts and brief, authentic selections. In addition to speaking, listening and reading skills, Cadets learn how to write short sentences on familiar topics. Through readings and discussions, Cadets are introduced to the culture and history of the French-speaking world. Cadets acquire a command of basic French vocabulary and gain a general understanding of how the language works, and become able to apply that knowledge when learning other foreign languages.                                                                                                                                                                                                                                                                              |                                | 2026-1 2027-1 2028-1<br>2029-1             |

| In the intensive intermediate course, cadets develop proficiency in those skills necessary for communicating effectively in French and for pursuing upper-level courses. Cadets develop speaking skills that enable them to engage in conversations on a variety of topics with other class members and with native speakers. Cadets reinforce and expand their language skills by reading, viewing, discussing, and writing about contemporary life, current events, and other cultural and historical topics as presented in selected materials of the French-speaking world. In addition, cadets gain an overview of the profession of arms in French-speaking regions by reading, discussing, and writing about pertinent materials that focus on the mission and history of the military in those countries. Cadets also review the basic rules of French grammar and continue to acquire a corpus of French vocabulary. They will be able to use computer-assisted learning resources to strengthen and maintain their language proficiency. This course serves as a bridge to advanced elective French courses. |                                | 2026-1 2027-1 2028-1<br>2029-1             |

| This course addresses students' specific needs in the development of listening, speaking, reading, and writing skills in French. Cadets expand their active vocabulary, gain greater command of complex grammatical structures, and develop appropriate styles of written and oral communication. Special emphasis is placed on conversational and expository speaking. Cadets increase their oral proficiency through dialogues, role play, group discussions, formal presentations, and simulations of everyday language tasks likely to be encountered in the target region. Guided writing activities develop Cadets' competence in the application of critical language structures. Listening and reading comprehension are strengthened via engagement with film, music, short stories, news reports, and other popular media. Course topics typically focus on regional culture, the military, and society.                                                                                                                                                                                                     |                                | 2026-2 2027-2 2028-2<br>2029-2             |

| In this course cadets enhance their reading and writing skills through study and discussion of contemporary French media (e.g. the Internet, television, film, radio, newspapers and magazines), as well as short literary selections. Reading strategies and textual analysis are addressed. Writing tasks develop organization, substance, and style. Graded work typically includes oral and written summaries of authentic texts and short compositions or reaction papers. The course is conducted in French.                                                                                                                                                                                                                          |                            |                                            |

| Cadets gain an understanding of the profession of arms in the French-speaking world through lectures and selected reading materials (e.g. journal articles, Internet media, training manuals, biographies, and historical documents). Course content may encompass the mission and role, training, operations, tactics, and organization of the armed forces. Oral proficiency is enhanced through in-class discussion as well as role-plays and simulations focusing on scenarios likely to be encountered while an officer is deployed in a French-speaking region. Media complement instruction. Graded work may include briefings, role-plays, and simulation. The course is conducted in French.                                       |                            |                                            |

|--------------|-------------------------------|----------------------------------------------------------|

---

**Scope:** 2025-1

**Offerings:**

This course is a survey of French literature tracing its development from the Middle Ages through the 18th century. Cadets gain basic competence in the knowledge and comprehension of representative literary works and their relationship to the cultural context of French society. Selected examples of various literary genres are read, discussed, and analyzed. At the same time, cadets continue to develop greater proficiency in French. Video and film presentations supplement readings, where possible. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in French.

---

**Scope:** 2025-1

**Offerings:**

In the standard course sequence, Cadets acquire a basic proficiency in speaking, listening, reading and writing skills in German. Learning activities focus on situations Cadets are likely to encounter in German society. Cadets are taught how to express simple ideas and basic needs, comprehend the language in everyday contexts, and read simplified texts and brief, authentic selections. In addition to speaking, listening and reading skills, Cadets learn how to write sentences, paragraphs and/or short compositions on familiar topics. Through readings and discussions, Cadets are introduced to the cultures and history of the German-speaking world. Cadets acquire a command of basic German vocabulary and gain a general understanding of how the language works, and they become able to apply that knowledge when learning other foreign languages.

|--------------|--------------------------------------|----------------------------------------------------------|

---

**Scope:** 2025-1

In the intensive intermediate course, cadets develop proficiency in those skills necessary for communicating effectively in German and for pursuing upper-level courses. Cadets develop speaking skills that enable them to engage in conversations on a variety of topics with other class members and with native speakers. Cadets reinforce and expand their language skills by reading, viewing, discussing, and writing about contemporary life, current events, and other cultural and historical topics as presented in selected materials of the German-speaking world. In addition, cadets gain an overview of the profession of arms in German-speaking regions by reading, discussing, and writing about pertinent materials that focus on the mission and history of the military in those countries. Cadets also review the basic rules of German grammar and continue to acquire a corpus of German vocabulary. They will be able to use computer-assisted learning resources to strengthen and maintain their language proficiency. This course serves as a bridge to advanced elective German courses.

**Lessons:** 80 @ 55 min (5.000 Att/wk)      **Labs:** 0 @ 0 min

|--------------|-------------------------------------------|----------------------------------------------------------|

---

**Scope:** 2025-2

This course addresses students' specific needs in the development of listening, speaking, reading, and writing skills in German. Cadets expand their active vocabulary, gain greater command of complex grammatical structures, and develop appropriate styles of written and oral communication. Special emphasis is placed on conversational and expository speaking. Cadets increase their oral proficiency through dialogues, role play, group discussions, formal presentations, and simulations of everyday language tasks likely to be encountered in the target region. Guided writing activities develop Cadets' competence in the application of critical language structures. Listening and reading comprehension are strengthened via engagement with film, music, short stories, news reports, and other popular media.

**Scope:** 2025-1

**Offerings:**

In this course cadets enhance their reading and writing skills through study and discussion of contemporary German media (e.g. the Internet, television, film, radio, newspapers and magazines), as well as short literary selections. Reading strategies and textual analysis are addressed. Writing tasks develop organization, substance, and style. Graded work typically includes oral and written summaries of authentic texts and short compositions or reaction papers. The course is conducted in German.

**Scope:** 2025-2

**Offerings:**

Cadets gain an understanding of the profession of arms in the German-speaking world through lectures and selected reading materials (e.g. journal articles, Internet media, training manuals, biographies, and historical documents). Course content may encompass the mission and role, training, operations, tactics, and organization of the armed forces. Oral proficiency is enhanced through in-class discussion as well as role-plays and simulations focusing on scenarios likely to be encountered while an officer is deployed in a German-speaking region. Media complement instruction. Graded work may include briefings, role-plays, and simulation. The course is conducted in German.

| Cadets learn that human language is a rule-based and universal system. They examine languages like those taught at USMA from the perspective of linguists, teachers and Army officers. Topics include the origin of and the basis for language, the nature of grammar, language sounds, the phenomenon of meaning, and how language attains communication. Knowledge gained is frequently interdisciplinary and relevant to courses offered at USMA in psychology, communication, English and foreign or second languages. Graded work may include giving oral presentations and completing a term project or paper. |                                                                                                                                                                                                                  | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| Cadets travel to selected sites where cultural and linguistic immersion is an opportunity. Cadets engage in structured activities and instruction in the target language. They visit sites of cultural and historical significance, and pursue a program of learning as approved by the Department of Foreign Languages that is similar to other IAD course experiences except for the number of credit hours awarded.                                                                                                                                                                                               |                                                                                                                                                                                                                  | No Course Offerings                                           |

| Cadets travel to and reside in a linguistic and cultural community for three weeks. There they use their knowledge of Arabic, its varieties and connected cultures to accomplish learning tasks, solve problems and live daily routines. A structured program of immersion may include visits to sites of military, political, historical, or social significance; official orientations and lectures; meetings with local or national civilian and military leaders; and directed language learning activities. A department instructor accompanies the participating cadets who are obliged to use Arabic during this extended stay.   |                             | 2026-7 2027-7 2028-7<br>2029-7             |
