| This course provides cadets with a comprehensive set of basic combatives skills suited for a combat scenario. Cadets will learn to respond appropriately to aggression by utilizing proper body mechanics, skills, aggressiveness, and fear management. Two combat ranges of hand-to-hand fighting are taught: 1) Grappling range - cadets learn to fight and win on the ground and, 2) Clinch range - cadets learn to close the distance and control the fight between themselves and an attacker. Cadets will be evaluated on their ability to perform selected combative skills and their capacity to exhibit the warrior ethos and fear management.                                                                                                                                                                                        |                                | 2026-1 2026-2 2027-1<br>2027-2 2027-3 2028-1<br>2028-2 2028-3 2029-1<br>2029-2 |

| This course prepares future officers for their role as fitness leaders by equipping them with content and experiences that cultivate their ability to plan, implement, and assess unit physical training under varied conditions. Course material emphasizes basic concepts of human physiology and the mechanisms by which the body adapts to and benefits from physical readiness training. Cadets will apply their knowledge of the United States Army's Holistic Health and Fitness (H2F) system in pursuit of optimizing unit (group) performance. Cadets must assess the physical requirements of units and Soldiers, program platoon level physical readiness training, and evaluate the efficacy of that training. Course graduates have the knowledge to enhance the health and human performance of the future units they will lead. |                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2                  |

| Advanced Sport Development is an intense physical program designed for cadets with an interest in total fitness and a comprehensive scuba experience. This program consists of four subcourses: Aerobic Fitness (mountain biking, hiking, kayaking, etc.), Sports Physiology, Muscular Fitness, and SCUBA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                | 2026-7 2027-7 2028-7<br>2029-7                                                 |

| The Outer Limits – Mountain Leader course is designed to provide cadets with the basic skills and knowledge needed to safely participate in basic to advanced rock climbing. Successful completion of this course allows cadets to participate in many levels of basic to advanced levels of lead rock climbing and prepare them for future experiences in a variety of climbing adventures to include ice climbing and mountaineering co-related adventures.                                                                                                                                                                                                                                                                                                                                                                                  |                                | 2026-7 2027-7 2028-7<br>2029-7                                                 |

| <p>This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in nuclear engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in nuclear engineering. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. NE189A and NE189B are follow-on variants of NE189.</p> |                                                                                                                                                                                                                                                    | No Course Offerings                                           |

This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in nuclear engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in nuclear engineering. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research.

2026-1 2026-2 2027-1  
2027-2 2028-1 2028-2  
2029-1 2029-2

**Lessons:** 0 @ 0 min (0.000 Att/wk)

**Labs:** 0 @ 0 min

**Special Requirements:**

Enrollment by permission of Nuclear Engineering Program Director. Other requirements as determined by the Faculty Advisor. The program director will determine the applicable amount MA, BS and ET credit for each course offering, when required.

**NE289A**

**INTERM IND STUDY NUCLEAR ENGR**

**2.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:**

2019-1

2022-1

**Offerings:**

This course provides the student with an understanding of the fundamental physical principles involved in radioactive decay, radiation interaction with matter, nuclear fission, and nuclear fuel material properties. The course covers neutron interactions with matter, fission, neutron lifecycle, neutron moderation, and reactor criticality. This course is essential for the nuclear engineer and is an excellent choice for the applied scientist.

This course focuses on nuclear engineering systems including radiation protection, shielding, and the uses of radioactive sources in industrial processes. Specific topics emphasize the operation of radiation detectors, shielding principles, health effects of radiation, radiological dispersion devices, and nuclear incidents. A design project applies the concepts presented in this course to the solution of practical problems.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** One design project.

|---------------|--------|-------------------|

This course focuses on nuclear reactor systems, the release of nuclear energy in the reactor core, and its removal as heat for producing electric power. Specific topics emphasize reactor kinetics, heterogeneous reactors, control rods and shim, reactor poisons, heat transfer, and alternative energy systems. The fundamentals of transport theory and the solution to the transport equation using Monte Carlo N-Particle (MCNPX) transport code are introduced. The laboratory component includes a student-designed lab.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 8 @ 120 min

**Special Requirements:** One paper and a student-designed lab project.

**Prerequisite(s):** NE300

|---------------|--------|-------------------|

This is a required course for nuclear engineering and nuclear engineering science majors. This course consists of an introduction to radioactive decay, radiation interactions and transport, and detailed instruction in the use and application of advanced nuclear engineering computational tools culminating in the design of a nuclear engineering system. This course is designed to provide an introduction to the science and theory behind modeling nuclear phenomena along with practical exposure to industry- standard computational tools used to design reactors, radiation shields, detectors and other nuclear systems. Specific topics include: radiation interactions and the Boltzmann transport equation, theory of deterministic and Monte Carlo methods for radiation transport, radioactive decay, problem solving using deterministic and Monte Carlo computer simulations, design of nuclear engineering systems, and analysis and validation of computational results.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

| This seminar will meet once each week and will include all first class cadets majoring in nuclear engineering. The seminar topics will address the concerns of professional nuclear engineers such as engineering ethics, economics, and licensing procedures. Guest lecturers will discuss topics of current interest in the field of nuclear engineering to include DoD initiatives in the FA52 (Nuclear Combating Weapons of Mass Destruction). Much of the seminar material will be presented by guest lecturers from the military, industrial, and academic communities. |                                                                                                                                 | 2026-2 2027-2 2028-2<br>2029-2                                |

| This course focuses on the operation of nuclear and fusion weapons, and the effects of a nuclear weapon detonation. Specific topics emphasize blast effects, thermal radiation, initial radiation and fallout, electromagnetic pulse, biological effects of radiation, and the policy issues associated with weapons of mass destruction. Extension problems with design components apply the concepts presented in NE450 to the solution of practical problems.                                                                                                              |                                                                                                                                 | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| <p>This course focuses on nuclear instrumentation and radiation detectors, and on biological and material radiation protection through shielding. Specific topics include a study of radiation, and radiation detection devices to include: ionization chambers, proportional counters, Geiger-Mueller counters, scintillation detectors, semiconductor diode detectors, germanium and sodium iodide gamma-ray detectors, and neutron detectors. Radiation shielding, as a force protection measure, includes the design, analysis, and confirmation of radiation shields using point kernel and removal diffusion methods. Emphasis is placed on practical application of the radiation detection instruments and the associated acquisition software.</p>                                                                                                                                                                                                                                        |                                | 2026-1 2027-1 2028-1<br>2029-1                                |

| <p>This is a mandatory course for Nuclear Engineering majors. The course relies on skills and techniques introduced in NE361 (Computational Design in Nuclear Engineering) and NE355 (Nuclear Reactor Engineering) along with advanced computer codes to design solutions to problems involving advanced reactor concepts, nuclear fuel cycles, nuclear shielding, unstructured mesh Monte Carlo problems, and radiographic imaging. The course includes reinforcement of a variety of computational solutions to the Boltzmann transport equation to include discrete ordinates and Monte Carlo simulations of subcritical and critical assemblies for thermal and fast reactor designs. The course includes a significant design experience where cadets will optimize a complex shielding problem using an unstructured mesh applied to a solid model CAD design. Analysis includes social, political, economic and environmental factors surrounding advanced reactors and shield designs.</p> |                                | 2026-1 2027-1 2028-1<br>2029-1                                |

| <p>This course focuses on application of radiation interactions with matter, biological effects of ionizing radiation, and radiological dose assessment. Specific topics emphasize radiation transformations, kinetics and particle interactions, early and late biological effects of radiation, internal and external exposure and dose calculations, radiation safety regulations, and application of health physics principles to reduce hazards in nuclear engineering.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                | 2026-1 2027-1 2028-1<br>2029-1                                |

| <p>This course is an individually supervised research and study program to familiarize students with advanced nuclear or radiological engineering procedures and techniques. The primary purpose is to acquaint students with the essential features of independent research in nuclear or radiological engineering. With the approval of the Head of the Department, the cadet chooses a research project currently in progress in the Department and is supervised by a faculty member conducting the research. The program director will determine the applicable amount MA, BS and ET credit for each course offering, when required.</p>                                                                                                                                                                                                                                                                                                                                                      |                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This is the first course in a two-semester capstone design experience. The course provides experience in the integration of math, science, and engineering principles into a comprehensive nuclear system design project. The design project emphasizes a multidisciplinary approach to total system design providing multiple paths to a number of feasible and acceptable solutions which meet the stated performance requirements. Design teams are required to develop product specifications, generate alternatives, make practical engineering approximations, and perform appropriate analysis to support the technical feasibility of the design, make decisions leading to an optimal system design, and brief their interim results during in-process reviews (IPRs). Topics such as engineering economics and the Code of Federal Regulations are introduced. Computational codes such as MCNP and other nuclear industry codes specific to the project will be introduced. |                                                                                                                                                                                                                                                                | 2026-1 2027-1 2028-1<br>2029-1                                |

| This is the second course in a two-semester capstone design experience. The course provides experience in the integration of math, science, and engineering principles into a comprehensive nuclear system design project. The design project emphasizes a multidisciplinary approach to total system design providing multiple paths to a number of feasible and acceptable solutions which meet the stated performance requirements. Design teams are required to develop product specifications, generate alternatives, make practical engineering approximations, and perform appropriate analysis to support the technical feasibility of the design, make decisions leading to an optimal system design, and brief their interim results during in-process reviews (IPRs). During this course, the design project is completed and presented to the project sponsor.                                                                                                             |                                                                                                                                                                                                                                                                | 2026-2 2027-2 2028-2<br>2029-2                                |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in physics on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in physics. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research.                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in physics on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in physics. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. PH189A and PH189B are follow-on variants of PH189. |                                                                                                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This required, calculus-based core physics course consists of a comprehensive study of classical mechanics. The course is designed to promote scientific literacy and to develop the use of the scientific method to solve complex problems. Topics include vectors, kinematics, Newton's laws, work, energy, torque, momentum, and rotational motion. An integrated laboratory program illustrates basic scientific techniques and serves to stimulate intellectual curiosity through discovery laboratories. The core physics program is designed to demonstrate the relevance of physics to military technology and to help prepare future Army leaders to anticipate and adapt to technological change.                                                                                                 |                                                                                                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

This calculus-based core physics course consists of a comprehensive study of electricity and magnetism. Topics include electrostatics, Gauss's Law, magnetic fields, Ampere's Law, Faraday's Law, circuits (direct current and alternating current), electromagnetic waves, geometric optics, physical optics, and elements of modern physics. An integrated laboratory program illustrates basic scientific techniques and serves to stimulate intellectual curiosity through discovery laboratories. The core physics program is designed to demonstrate the relevance of physics to military technology and to help prepare future Army leaders to anticipate and adapt to technological change.

**Lessons:** 40 @ 55 min (2.500 Att/wk)      **Labs:** 10 @ 120 min

**Special Requirements:** None

**Scope:** 2023-1 **Offerings:**

This required, calculus-based advanced core physics course consists of a comprehensive study of classical mechanics. The course is designed to promote scientific literacy and to develop the use of the scientific method to solve complex problems. Topics include vectors, kinematics, Newton's laws, work, energy, torque, momentum, and rotational motion. An integrated laboratory program illustrates basic scientific techniques and serves to stimulate intellectual curiosity through discovery laboratories. The core physics program is designed to demonstrate the relevance of physics to military technology and to help prepare future Army leaders to anticipate and adapt to technological change.

| Calculus-based core physics course serving as an introduction to space physics. The course includes an introduction to orbital mechanics, electricity and magnetism, and optics. The course is designed to promote scientific literacy of the physics principles governing the space domain to translate space-based effects into operational impacts. All topics will build an understanding of the capabilities, limitations, and vulnerabilities of space-based assets available to the modern warfighter. Additionally, an integrated laboratory program illustrates basic scientific techniques and serves to stimulate intellectual curiosity through discovery laboratories related to these military space assets. This core physics course is designed to demonstrate the relevance of physics to military space-based technology and to help prepare future Army leaders to anticipate and adapt to technological change. |                                                                                                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in physics on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in physics. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research.                                                                                                                                                                            |                                                                                                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in physics on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in physics. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. PH289A and PH289B are follow-on variants of PH289.                                                                                                                         |                                                                                                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in physics on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in physics. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. PH289A and PH289B are follow-on variants of PH289. |                                                                                                                | No Course Offerings                                                                          |

| This course provides instruction and experimental experiences designed to exercise the student's knowledge of classical and modern physics and to extend his or her familiarity with equipment and techniques used in a physical science laboratory. Cadets, working in groups, execute and report on experimental projects. The program of instruction includes familiarization with electronics and instrumentation, data analysis, and laboratory procedures and practices. Knowledge and skills acquired in this course are essential for subsequent laboratory work in solid state physics, nuclear physics, and optics.                                                                                                                                                                               |                                                                                                                | No Course Offerings                                                                          |

| This course introduces special relativity and the fundamental concepts of quantum physics with application to atomic physics and nuclear physics in order to prepare cadets for advanced study of science and engineering, especially quantum mechanics, statistical physics, nuclear physics, solid state physics, laser physics, medical radiation physics, and nuclear engineering. This course will also be of interest to any cadet who wishes to gain a deeper appreciation of the natural world or of the technology of the 21st Century.                                                                                                                                                                                                                                                            |                                                                                                                | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2027-8<br>2028-1 2028-2 2028-8<br>2029-1 2029-2 2029-8 |

| This course uses the experimental and laboratory skills developed in PH361 to explore the applications of the 20th Century developments studied in PH365. The topics covered will vary but may include molecular structure, the properties of solids including metals and semiconductors, nuclear physics, and elementary particle physics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                         | No Course Offerings                                |

| This course continues the development of physical principles introduced in the core physics curriculum. Direct application of Newton's laws is used to analyze phenomena such as projectile motion with air resistance, charged particle motion, and motion in a central force field. Harmonic, driven, and damped oscillations are studied in depth, as are systems of coupled oscillators. The formalism of Lagrangian mechanics is studied in depth. The mathematical tools of classical mechanics are introduced, to include vector fields, line integrals, the calculus of variations, linear algebra, and eigenvalue equations. Cadets will be required to develop and demonstrate the ability to use a computer algebra system to solve advanced problems and plot the solutions.                                                         |                                         | 2026-1 2027-1 2028-1<br>2029-1                     |

| This course continues the study of classical electrodynamics introduced in the introductory physics sequence by developing the differential forms of the Maxwell equations and applying them to boundary value problems in two and three dimensions. In addition, scalar and vector potentials are introduced, multipole field expansions are developed for complex sources, electromagnetic fields in dielectric and magnetic media are studied, the propagation of electromagnetic waves in conducting and nonconducting media is considered and electromagnetic radiation is introduced. The course concludes with the study of the connection between special relativity and electrodynamics. This course provides an essential foundation for courses in optics, lasers, quantum mechanics, statistical mechanics, and solid state physics. |                                         | 2026-1 2026-8 2027-1<br>2028-1 2029-1              |

| This course provides intermediate development in the concepts of geometric, wave, and quantum optics. Primary coverage includes common optical devices, light transmission through optical media, diffraction, interference and polarization. Applied topics typically include: Fourier optics, holography, imaging, atmospheric effects, optical and infrared detectors, nonlinear optics, and tactical employment considerations. |                                      | 2026-2 2027-2 2028-2<br>2029-2 2029-8 2029-9                  |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The primary purpose is to acquaint students with the essential skills required for independent research in physics. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. |                                      | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The primary purpose is to acquaint students with the essential skills required for independent research in physics. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. |                                      | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The primary purpose is to acquaint students with the essential skills required for independent research in physics. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research.                                                                                                                                                                                                                                                                    |                                                                                       | 2029-2                                             |

| This course challenges cadets to draw upon their core academic experience to analyze complex policy issues. The relationship and interaction between social, political, economic, and technological dimensions of these issues are explored. Emphasis is given to gaining an understanding of both the power and limitations of science and scientific thinking when confronting problems in the policy arena.                                                                                                                                                                                                                                                                                         |                                                                                       | 2026-1 2027-1 2028-1<br>2029-1                     |

| This course applies basic concepts of probability and statistics to systems consisting of a large number of particles to determine measurable macroscopic quantities such as temperature, pressure, energy, and heat capacity. Emphasis is placed on the calculation of the canonical and grand canonical partition functions for various model physical systems. Particular attention is focused on three ideal gas systems: a gas consisting of massive Maxwell-Boltzmann particles, a gas consisting of massless bosons (i.e., photons), and a gas consisting of fermions.                                                                                                                          |                                                                                       | 2026-2 2027-2 2028-2<br>2029-2                     |

| This course continues the development of concepts introduced in PH381. Hamiltonian mechanics is explored using the calculus of variations to provide a foundation for connecting classical mechanics, quantum mechanics, and statistical mechanics. The two-body central force problem, the mechanics of rotating systems, and scattering theory are studied in depth. The mathematical techniques associated with cylindrical, spherical, and curvilinear coordinates are introduced, as are the basic principles of nonlinear dynamics and chaos. Cadets will be required to develop and demonstrate the ability to use a computer algebra system to solve advanced problems and plot the solutions. |                                                                                       | 2027-2 2028-2 2029-2                               |

| This is the first in a two-course sequence in Quantum Mechanics. This course begins with a basic introduction to the fundamental postulates of quantum theory. These postulates are then used to develop Heisenberg's uncertainty principle and Schroedinger's equation. Solutions to Schroedinger's equation are sought, first for relatively simple systems such as square wells and harmonic oscillators, and then for the hydrogen atom. The properties of the hydrogen atom are studied in detail. The course also covers approximation methods used for physical systems with small perturbing forces acting on them. |                                   | 2026-1 2027-1 2028-1 2029-1                             |

| This course provides a combined theoretical and experimental investigation into the realm of coherent optical radiation generation, amplification, propagation, and application. Cadets apply the basic principles of electromagnetism, optics, and modern physics to analyze specific laser systems. Emphasis is placed on evaluation of laser systems, and experiments are performed to demonstrate properties of specific systems. Selected topics in modern optical engineering are explored to illustrate basic applications of various systems. Laser theory is investigated using semiclassical methods.             |                                   | 2026-1 2027-1 2028-1 2029-1                             |

| This course provides instruction and experimental experiences designed to exercise the cadet's knowledge of classical and modern physics and to extend their familiarity with equipment and techniques used in a physical science laboratory. Cadets, working in groups or by themselves, integrate a variety of physics theories and experimental techniques. The program of instruction includes applications of electronics and instrumentation, data analysis, and laboratory procedures and practices.                                                                                                                 |                                   | 2026-2 2027-2 2028-2 2029-2                             |

| This is the second in a two-course sequence on Quantum Mechanics. This course covers the application of the fundamentals learned in the first course of the sequence. The topics include, but are not limited to perturbation theory (time independent and time dependent), the variational principle, the WKB approximation, the adiabatic approximation, and quantum scattering.                                                                                                                                                                                                                                          |                                   | 2026-2 2027-2 2028-2 2029-2                             |

| This course is an individually supervised research and study program to familiarize students with advanced scientific procedures and techniques. The primary purpose is to acquaint students with the essential features of independent research in physics. With the approval of the Head of the Department, the cadet chooses a research project currently in progress in the Department, and is supervised by a faculty member conducting the research.                                                                                                                                                                  |                                   | 2026-1 2026-2 2027-1 2027-2 2028-1 2028-2 2029-1 2029-2 |

| This course is a second course in an individually supervised research and study program to familiarize students with advanced scientific procedures and techniques. The primary purpose is to foster the student's continued development of the essential features of independent research in physics. With the approval of the Head of the Department, the student continues with a research project currently in progress in the Department, and is supervised by a faculty member conducting the research.                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is taught by the Class of 1967 Endowed Chair or another faculty member who is not occupying an authorized USMA position, including any visiting scholar with a distinguished record of academic and professional achievement in the field of engineering, science, and technology. The Special Topics in Physics course focuses on topical issues that reflect the technical expertise of the Chair or visiting scholar. Students will apply math, science, and engineering fundamentals they have learned to these studies.                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                | 2026-2 2027-2 2028-2                                          |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in space and missile defense on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in space and missile defense. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. |                                                                                                                                                                                                                                                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in space and missile defense on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in space and missile defense. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. SP189A and B are follow-on variants of SP189.                                                                                                                                                            |                                                                                                                                     | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in space and missile defense on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in space and missile defense. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. SP189A and B are follow-on variants of SP189.                                                                                                                                                            |                                                                                                                                     | 2026-1 2026-2 2029-1<br>2029-2                                |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in space and missile defense on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in space and missile defense. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. SP189A/B/C are follow-on variants of SP189.                                                                                                                                                              |                                                                                                                                     | 2029-2                                                        |

| Calculus-based core physics course serving as an introduction to space physics. The course includes an introduction to orbital mechanics, electricity and magnetism, and space weather. The course is designed to promote scientific literacy and to develop the use of the scientific method to solve problems. All topics will feed into understanding the capabilities, limitations, and vulnerabilities of the warfighter's space-based assets. Additionally, an integrated laboratory program illustrates basic scientific techniques and serves to stimulate intellectual curiosity through discovery laboratories that are entirely related to the warfighter's space-based assets. This core physics course is designed to demonstrate the relevance of physics to military space-based technology and to help prepare future Army leaders to anticipate and adapt to technological change. **This is a pilot course and must be reviewed by the Curriculum Committee NLT 24-2 to continue.** |                                                                                                                                     | No Course Offerings                                           |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in space and missile defense on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in space and missile defense. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research.                                                    |                                                                                                                                     | 2026-1 2026-2 2027-1<br>2027-2 2027-7 2028-1<br>2028-2 2028-7 2029-1<br>2029-2 2029-7 |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in space and missile defense on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in space and missile defense. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. SP289A and SP289B are follow-on variants of SP289. |                                                                                                                                     | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2                         |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in space and missile defense on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in space and missile defense. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. SP289A and SP289B are follow-on variants of SP289. |                                                                                                                                     | 2026-1 2029-1 2029-2                                                                  |

| This course is an individually supervised research and study program to familiarize cadets with advanced scientific procedures and techniques. The cadet pursues study of a research or design topic in space and missile defense on an individual or small group basis, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project but the primary purpose is to acquaint students with the essential skills required for independent research in space and missile defense. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. SP289A/B/C are follow-on variants of SP289.        |                                                                                                                                     | 2029-2                                                                                |

Space Physics is concerned with understanding the environment between the sun and the Earth's upper atmosphere as well as the environment within the entire heliosphere. This course provides understanding of the structure and dynamics of the Sun, including solar events such as sun spots, prominences, coronal mass ejections and solar flares. That understanding is then used as a basis to understand the solar wind and its influence on the heliosphere to include influences on our terrestrial magnetosphere, ionosphere and thermosphere. In addition, magnetospheric storms and auroral precipitation are among phenomena studied in the context of their effects on spacecraft, satellites, and also terrestrial systems and life in general.

| This course is an introduction to the history, principles, and application of astronomical observation focusing on visual, photometric, and spectroscopic techniques. Cadets will be introduced to the methods and tools employed in modern astronomical observatories. Emphasis is placed on data analysis and statistics, geometrical and physical optics of telescopes, time systems, catalogs, and images obtained by telescopes equipped with light detectors. The course will include real-time observation of celestial objects, starting with objects in our solar system and expanding to the Milky Way. |                                                                                                                                                                                                                                                                                                                                                                                     | 2026-1 2027-1 2028-1<br>2029-1                     |

| This course is an introduction to Astrophysics and is a study of stellar structure and evolution, galactic structure, and cosmology. Phenomena of interest include quasars, black holes, supernovae and the cosmic microwave background radiation. Special emphasis will be placed on those galactic phenomena, such as Galactic Cosmic Rays (GCRs) and Anomalous Cosmic Rays (ACRs), which have an impact on our heliosphere. Supporting topics include an overview of orbital mechanics and relevant physics, observation techniques, and nuclear physics. |                        | 2026-2 2027-2 2028-2<br>2029-2 |

| <p>This course presents the basic principles of economic analysis and their application to contemporary economic problems and supports the further study of economics and related disciplines in the social sciences. The course is organized into two primary branches: microeconomics, the study of the behavior of individuals, households, and firms in making decisions, in a market economy and the application of this theory to contemporary issues in both domestic and global markets; and macroeconomics, the study of the performance, structure, and behavior of the whole economy including issues of national income, output, consumption, unemployment, inflation, as well as fiscal and monetary policy. In addition, the course includes instruction on personal finance, focusing specifically on major purchase decisions (home and auto), insurance, basic investing, and investing for retirement. This instruction is intended not only to improve individual financial decision-making but also to equip Cadets with the ability to address the financial issues of their future Soldiers. Cadets develop analytical tools in order to assess the economic implications of policy decisions by military and government officials and to improve their own decision-making process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |                                  | 2026-1 2026-2 2026-5<br>2026-8 2027-1 2027-2<br>2027-5 2027-8 2028-1<br>2028-2 2028-5 2028-8<br>2029-1 2029-2 2029-5<br>2029-8 |

| <p>This course explores the American political system - its philosophical underpinnings, the structure and behavior of formal government institutions, and the influence of informal political actors within the political construct. The course introduces the discipline of political science by exploring a broad range of literature: classics of American politics, leading political theory, and contemporary reading. Cadets will apply their knowledge of political ideas, institutions, and behavior to public policy making and demonstrate critical analysis of contemporary debates in American politics. Finally, this course provides cadets with an understanding of the professional norms and responsibilities associated with their role as military officers within the American system of government.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                  | 2026-1 2026-2 2026-5<br>2026-8 2027-1 2027-2<br>2027-9 2028-1 2028-2<br>2028-9 2029-1 2029-2<br>2029-5 2029-8                  |

| <p>This course explores the American political system, its philosophical underpinnings, the structure and behavior of formal government institutions, and the influence of informal political actors within the political construct. The course introduces the discipline of political science by exploring a broad range of literature: classics of American politics, leading political theory, and contemporary reading. Cadets will apply their knowledge of political ideas, institutions, and behavior to public policy-making and demonstrate critical analysis of contemporary debates in American politics. Cadets enrolled in SS252 are expected to conduct advanced undergraduate research that includes identifying additional readings related to policy debates for incorporation into policy-related classes, as well as a miniature literature review as part of their culminating research paper. These analytical research requirements exceed those levied on SS202 cadets. Further, SS252 cadets are exposed to additional seminal works in political science throughout the course, including classical political philosophy, primary historical documents from early American politicians and political thinkers, and contemporary works on civil-military relations. Finally, this course provides cadets with an understanding of the professional norms and responsibilities associated with their role as military officers within the American system of government. Aided through additional readings, this emphasis on civil-military relations focuses on contemporary and historical debates over the appropriate role of military involvement in policy development and the political process.</p> |                                  | 2026-1 2027-1 2028-1<br>2029-1                                                                                                 |

| <p>The colloquium provides cadets an opportunity for reading and analysis in depth in a topic area of special interest and timely relevance to their concentration. The course employs the seminar approach in which the instructor meets with small groups to discuss assigned readings, and cadets present their own analyses to the group. Course directors develop topics and determine the semesters in which they will be offered. Department Academic Counselors then forward course offerings and descriptions to Social Science majors and those majoring in areas related to the colloquium topic. Topics will vary by year to advantage the expertise of visiting professors or senior fellows. **This is a pilot course and must receive approval by the CC NLT AY26 to continue.**</p>                                                                                                                                |                                   | 2026-1 2029-1 2029-2                               |

| <p>This course prepares students to participate in the International Affairs capstone Senior Thesis in the following term. The course will be conducted through a combination of class (group) meetings and 1-on-1 individual meetings with Course Director, both types to be scheduled at the latter's discretion. It familiarizes cadets with the research procedures, techniques, and topics for future study undertaken in support of independent research, as determined by the faculty advisor (course director). In general, cadets will explore a topic in detail to create a literature review and understand the current methodology used to study that topic. Grades will be determined through individual assignments, including class participation, response papers, and research building-block assignments. The outcome of the course is a research design that forms the basis for the cadet's senior thesis.</p> |                                   | 2026-2 2027-2 2028-2<br>2029-2                     |

| <p>This introductory course prepares students who will participate in the International Affairs capstone Senior Project in the following term. It familiarizes cadets with the research procedures, techniques, and topics for future study, undertaken in support of an outside client. The scope of the course depends on the needs of the project and the needs of the cadets, as determined by the faculty advisor (course director). In general, cadets will select topics, form teams, meet with the client, and begin the research process. Grades will be determined through individual and group assignments, including class participation, response papers, and research building-block assignments. The outcome of the course is a research design that forms the basis for the cadet team's research paper for the client</p>                                                                                         |                                   | 2026-1 2027-1 2028-1<br>2029-1                     |

The objectives of this course are to provide cadets with an introduction to the fundamental concepts of international relations and the analytical tools necessary to evaluate two fundamental questions: "Why do states do what they do?" and "What causes conflict and cooperation in the international system?" Emphasizing intellectual pluralism, SS307 focuses on the value of applying different theoretical perspectives to historic cases and contemporary events in international affairs. Cadets will employ international relations theory to examine key issues such as the role of power and the use of force in the international system, the international political economy, the role of identity and culture in state behavior, foreign policy decision-making, and the role of morality and ethics in international affairs.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Scope:** 2024-1

**Offerings:**

This course is an introduction to research methods for political science majors. It serves two main purposes. First, this course introduces research design and the myriad methodologies employed by scholars as they engage in debates within the political science community and beyond. This course will cover many aspects of research design, but will focus primarily on the ability to ask good questions and to craft research plans to best answer those questions. Second, the course is an introduction to some of the major debates within political science. The course equips students with the tools to understand and conduct research in political science in upper-level electives.

**Scope:** 2005-2

**Offerings:**

Game theory is designed to provide students with the tools necessary to think through the various courses of action available as they face a uncertain situations, determine market reaction to each alternative, identify the costs and benefits of each course of action and select the course of action that minimizes cost while maximizing benefits. The purpose of this course is to introduce cadets to the application of strategic thinking to tactical scenarios. This course consists of two components that are taught concurrently. The first component is the introduction of basic game theory and the second component is the application of those theories to tactical and strategic choice scenarios.

**Scope:** 2020-2

**Offerings:**

SS366 examines critical questions in political science: Why do regimes succeed, fail, and change? What causes democracy to emerge? Why are some countries torn by conflict while others are peaceful? Cadets will analyze states, regimes, society, identity, and political action in order to address these vital issues related to the internal workings of a country. As well as being central to the discipline of political science, these questions also play an important role in world politics and the formulation of U.S. foreign policy. Through examining countries around the world, SS366 uses real-world examples and empirics to discern potentially generalizable relationships. Studying Comparative Politics will provide cadets the tools to critically analyze these important questions.

**Offerings:**

This course is designed to teach students how to quantify, test, and employ economic theories as they are used in real world applications. The course covers the use of economic theory and data in the construction, estimation, and interpretation of econometric models. Special emphasis is placed on estimation of parameters of economic models and statistical inference using estimated models to determine the validity of economic theories. The primary mathematical tool employed in the course is multiple regression analysis. A number of applications demonstrate the use of the techniques studied.

**Scope:** 2019-2

**Offerings:**

This seminar introduces cadets to what is perhaps the single most influential private institution in the American political system, oftentimes referred to as the fourth branch or fourth estate of American government. This course examines the major concepts, theoretical frameworks, and substantive issues surrounding the study of the media as a conduit between the people and the government and as a political actor in its own right. In particular, the roles, motivations, and effects of the constitutionally protected media on American political institutions and policymaking are extensively probed. The latter part of the course is dedicated to the study of the relationship between the military and the media, and prominent guest speakers are featured throughout the course to add context and practical application to the theories learned in class. The class includes a trip section to New York City to meet with journalists and news executives from national media outlets to round out the educational experience.

| SS372 is a seminar-style course designed to provide a framework for understanding and analyzing China's history, economics, domestic politics, and foreign policy. To do so, cadets study the history and current structure of the Chinese regime in order to explore the sources of power and legitimacy in the People's Republic of China. Domestic challenges and opportunities receive attention as the class critically analyzes policy choices. In the foreign policy realm, the class examines sources of continuity and change, seeking to explain current actions and predict future responses.                                                                                                                                                                                                     |                                                                                                          | 2026-1 2026-8 2027-1<br>2028-1 2029-1      |

| This seminar examines the concept of executive power and authority with particular emphasis on the institution of the presidency in the American political system. The course will analyze the constitutional origins and evolution of the presidency. We will place particular emphasis on the formal rules and informal norms that developed since the Founding and frame presidential behavior. We will analyze the various factors that influence the perpetual transformation of the institutional organization and operation of the modern executive branch. The course will examine the dynamic relationships the executive branch maintains with other branches of government, the media, the public, and other key stakeholders and how these relationships shape the development of public policy. |                                                                                                          | 2026-1 2027-1 2028-1<br>2029-1             |

| SS374 is a seminar course designed to challenge cadets to think about why East Asian actors ? states, non-state actors, organizations, and individuals ? do what they do, both within and beyond the region. Students will apply the social scientific method and various social science theories to explain how and why East Asian actors make certain policy choices. Students will explore how pursuits of national interests create competition, cooperation, and conflict across political, economic, and military spectrums. Cadets will integrate and apply knowledge to describe, explain, analyze, or predict international affairs and domestic political developments as well as identify implications and develop feasible policy options.                                                       |                                                                                                          | No Course Offerings                        |

SS375 explores the fascinating - and often confounding - politics of Russia and the other states that once comprised the Soviet Union. Recognizing the role that historical legacies play in shaping the region's contemporary politics, the course begins with a review of the political, economic, and social history of the Soviet empire and its abrupt collapse in 1991. The course then shifts to an exploration of contemporary post-Soviet politics, utilizing political science theories and methods to explore a wide variety of political phenomena in the region including democratization, authoritarianism, mass mobilization, economic transition and reform, governance and corruption, nationalist conflict, and more. Finally, the course examines the international relations of the post-Soviet states, with particular emphasis on the ends, ways, and means that Russia uses to advance its strategic interests in the region and beyond.

**Scope:** 2026-1

**Offerings:**

This course is organized around questions addressed by the major subfields of American Politics. It builds on the knowledge from research methods and political thought to introduce cadets to some of the major puzzles addressed by political scientists in American Politics. Cadets will read influential primary sources and empirical studies that shape our understanding of the questions posed in this course. In doing so, cadets will become familiar with the wide variety of theoretical approaches, research designs, and methodologies that scholars of American Politics use to advance our knowledge of the field.

**Scope:** 2020-2

**Offerings:**

In SS377, cadets explore the domestic and international politics of the European states, using a wide array of political science theories and methods to explain and predict state behavior in the region. They will examine the political and economic institutions of European states as well as explain how those institutions developed over time. They will also examine the development and functioning of European international institutions with special emphasis on the institutions of the European Union. Finally, cadets will use theory to predict how European institutions might evolve in the future under the stress of various contemporary challenges. This course builds on the theoretical foundations laid by SS366 and SS307/SS357.

**Scope:** 2020-2

**Offerings:**

One of the defining features of international relations at any point in history has been the distribution of power among the major states and the character of the political, economic, and military relationships among them. This course draws from the major schools of international relations theory to explore the underlying causes of war and peace among great powers, from the clash between Athens and Sparta in the 5th Century B.C., to great power politics of the 19th Century, the World Wars of the early 20th Century, and the Cold War between the United States and the USSR. The course concludes by examining how we might apply the theoretical and historical lessons of earlier periods to the challenge of great power politics among the United States, China, and Russia in the 21st Century.

This course deals with the origins, institutional evolution, and behavior of the United States Congress. It focuses on the role of Congress in representation and policymaking within the American political system. The course addresses the development of the United States Congress, congressional campaigns and elections, the tension inherent in Members of Congress acting both as representatives for their constituents and policymakers for the nation, the structure and behavior of committees, the responsibilities of legislative leaders, and the interaction between Congress and the Executive and Judicial branches. Case studies, practical exercises, and guest lecturers are used to highlight these topics.

This course studies the nature and determinants of pay and employment. The course emphasizes the role of institutions which are significant in determining the pattern and speed of adjustment in the labor market. The traditional tools of micro and macroeconomics and econometrics are employed. Military manpower is examined as an application of the theories developed during the course.

This course is a theory course in which cadets develop a thorough understanding of microeconomic modeling and models; it is a prerequisite for most downstream economics courses. The course develops a methodology that economists use to study the interaction among individual economic agents (such as consumers, firms and the government) and the allocation of scarce resources among these agents. The goal is for cadets to understand optimization, markets, and to some extent policy-making, using an integrated, theoretical model. Ultimately the consequence of a change in the market environment, in public policy or in the global economy can be assessed vis-à-vis its impact on individual economic agents.

| Many countries in the Middle East suffer from significant challenges including weak states and institutions, authoritarian persistence, and economic instability. Scholars have explained these issues by assessing the role played by political culture, economic structures, colonialism and foreign interventions and states have tried to find solutions through Arab Nationalism, Pan-Arabism, Islamism and other avenues. This course examines these challenges, offers explanations for these problems, and explores potential solutions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                       | 2026-2 2027-2 2028-2<br>2029-2 2029-8 2029-9 |

| SS384 examines the politics of Latin American countries by applying the theories, methodologies, and conceptual tools provided by the disciplines of comparative politics and international relations. In the course students will study phenomena such as democratic regimes, authoritarian regimes, political transitions, political participation, political institutions, socio-economic development, and foreign policy within Latin America and its member countries. At the conclusion of this course, students can apply comparative political science approaches to understand Latin American politics, have a deeper understanding of Latin American history and policies, and develop a greater familiarity with the tools of social science.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                       | 2027-1 2027-9 2028-1<br>2028-9               |

| This course conducts a general study of the history of economics by examining specific economic thinkers and the economic development of the United States and its institutions placed within a historical context. Institutions influence our nation's economic system, culture, political process, conflict resolution mechanisms, financial systems, and labor/management boards to name a few. Due to changes in these institutions and our nation's laws over time as a product of historical events and periods, the economy differs in terms of efficiency, growth potential, and equity in allocating resources. The first course block examines, compares, and contrasts a variety of history's prominent economic thinkers and their philosophies from Adam Smith to modern economists. It explores how we think about economics in terms of historical context, theory, and the formation of various schools of economic thought. The second course block conducts an overview of the United States economy and its development through the historical context and lens of significant events and distinctive periods of American history starting with the colonies and ending with contemporary challenges facing the country. This block explores how the US government has taken deliberate steps to adjust the capitalist economic system. Included are examinations of efforts to promote economic growth, the causes and impacts of significant economic events, and steps taken to stabilize and reform the economies of nations following major military conflicts. A small part of the block is devoted to war financing. By examining these significant changes or turning points in our nation's history, cadets can better apply economic ideas to the events or periods to help understand the current relevance of the material. |                                                                                                                                       | 2026-2 2027-2 2028-2<br>2029-2               |

| This course introduces students to the fundamental questions of political life, as expressed in classic works of political philosophy. The course presents the history of political thought as a series of debates over the meaning of justice, man's place in nature, and the human good. Students explore three main approaches to these questions - ancient, medieval, and modern - and they compare and contrast Western ways of wrestling with fundamental questions to others that have arisen outside the West. The course culminates in a consideration of the place of the American regime in the history of political thought.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                    | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2027-9<br>2028-1 2028-2 2028-9<br>2029-1 2029-2 2029-8 |

| This course examines the fundamental questions of Western political philosophy. In order to better understand why these problems are of vital relevance to contemporary civilization in the late modern West, students consider six themes: the nature of politics and how theorists, citizens, and statesmen have understood political things; the nature of freedom and the conditions necessary for its establishment, maintenance, preservation, and improvement; republicanism in antiquity and modernity; liberal democracy and constitutional order; the relationship between religion and politics; and, the fundamental presuppositions of traditional, modern, and contemporary social science. This course allows students to achieve critical understanding of the ancient and modern foundations of Western political thought and how these ideas have contributed to American republicanism, liberal democracy, and representative government; to clarify a range of modern political problems at home and abroad that challenge civilization; to acquire a competence reading, writing about, and discussing classic works of political philosophy, fostering life-long learning on masterpieces of human reflection; to develop cross-disciplinary capacity to study politics by (a) integrating basic chronological knowledge of what has happened in Western intellectual life, (b) understanding how to study ideas as vital components of traditional liberal education and officer development, (c) writing a Seminar Essay that synthesizes course learning, (d) making use of language study, grammar, etymology, and philology, and (e) keeping a Commonplace Book; to apply political thought to contemporary circumstances; and, to contrast Western principles with a major non-Western tradition of political thought. |                                                                                                    | No Course Offerings                                                                          |

| This course is an applied microeconomics course focusing on theoretical models to answer real world policy issues in the public sector. In particular, this course examines issues in public expenditures, social insurance, social welfare, redistribution, taxation, and public choice. Using economic models, this course helps students sharpen their analytical skills to solve complex governance challenges. Cadets should gain a better understanding of unique challenges that governments face when providing services while trying to balance economic efficiency with social equity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                    | 2026-1 2026-8 2027-1<br>2027-8 2028-1 2028-8<br>2029-1 2029-8 2029-9                         |

This course is dedicated to the study of aggregate economic activity. The course examines the determinants of long run growth, and then addresses short run economic fluctuations. The course uses various models, including the Solow Growth Model, the IS-IM model, and the Aggregate Demand - Aggregate Supply model. The microeconomic foundations for macroeconomics are discussed, and current macroeconomic policy issues are debated. These issues are discussed within the context of both open and closed economies.

**Scope:** 2022-1

**Offerings:**

This course will cover how insights from psychology and behavioral economics relate to the foundational economic model of rational choice. This course will cover four main topic areas. First, the course will examine how individual preferences tend to deviate from a rational choice model. Second, the course will explore how cognitive limitations alter individual choice. Third, the course will look at how social preferences and social influence impact decisions. Fourth and finally, this course will investigate how public policy interacts with individual behavioral tendencies.

**Scope:** 2025-2

**Offerings:**

This seminar focuses on political actors, institutions and processes as they relate to the concepts of civil rights and civil liberties. Emphasis is placed on how political participation and engagement influence civil rights and civil liberties in the American political system. The course considers how institutions and informal actors shape the domestic policymaking process pertaining to civil rights and civil liberties, and also includes discussions about how these issues apply to the roles and responsibilities of Army officers.

**Scope:** 2025-1

**Offerings:**

Fundamentals of Financial Data Analysis teaches cadets the principles of financial data, the tools of understanding financial information, and the application of econometric methods to analyze financial markets, estimate relationships, and make informed finance-related decisions. Cadets will use companies' and market financial data to measure performance and assess financial position. Additionally, cadets will be exposed to the fundamentals of valuing equity, debt, and diverse investment instruments. To accomplish this, students will explore various econometric techniques commonly used in financial research, such as linear regression, time series analysis, and forecasting. The course places emphasis on understanding the theoretical underpinnings of these methods and their practical implementation in asset pricing, evaluating stock performance and volatility, and risk management.

| <p>This course uses the foundation provided by SS307/SS357 to explore one of the critical forces that drives world politics - international security. The purpose of this course is to provide students a solid foundation in the field of international security studies - one of the major sub-fields of the international relations discipline - including a grasp of key concepts and case studies relevant to the field today and throughout history. Students will examine fundamental questions in this field, including "What is security?" "What causes war, and what prevents it?" and "How do actors in the international system use force as a tool to achieve goals and influence others?" As a "Writing in the Major" course for the Security Studies and Foreign Policy track of the International Affairs major, students should expect heavy emphasis on writing assignments as a key tool for developing, communicating, and validating their understanding of course material.</p>                                                                                                    |                                                                          | 2026-1 2027-1 2028-1 2029-1                |

| <p>The Academic Individual Advanced Development (AIAD) program is designed to give cadets practical experience in their field of study and to reflect on their experiences by completing specified academic requirements. Recent internships involve participation in the American, European and Russian (AMEURU) program hosted by the University of Maastricht, the Tri-Service Global Spectrum trip to Vietnam, study at the German Marshall Center, the American Institute on Political and Economic Systems (AIPES) in the Czech Republic, the International Institute for Political and Economic Studies (IIPES) in Greece, and the International Studies Program (ISP) in Eastern Europe. Scope, depth and material covered will meet the requirement of a 3-credit hour course in Social Sciences. Grades are determined based on preparatory briefings and essays, a journal of daily activities, the quality of the work performed during the internship, and a final paper, briefing, or exam that incorporates their experience with a topic from their field of study, due upon return.</p> |                                                                          | 2026-7 2027-7 2028-7 2029-7                |

| <p>This seminar examines the fundamentals of grand strategy in theory and in practice. It addresses the historical moment in which the modern concept of grand strategy was born and explores the major debates that have animated scholars and practitioners since. We focus on the core building blocks of grand strategy: the elements of national power that are available to be coordinated and applied in a coherent fashion across policy contexts. We analyze historical case studies to explore how the modern concept of grand strategy can be retrospectively applied to explain state behavior across time and diverse contexts. The seminar ultimately aims to prepare future Army officers to apply concepts from grand strategy to analyze and address complex problem sets in the contemporary international environment.</p>                                                                                                                                                                                                                                                            |                                                                          | 2029-2                                     |

| <p>SS458 Applied Topics in Grand Strategy is the second of a two-part sequence designed to build on the course material covered in SS457. The course will cover applied regional and thematic topics in the study of grand strategy in a contemporary and/or historical context to illustrate key theoretical concepts. Scope, depth and material covered will meet the requirement of a 3-hour credit course in the Grand Strategy Program. Grades are determined based on presentations, essays and other writing exercises, class participation, and a final exam, essay, and/or briefing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                          | 2026-1 2029-1                              |

| <p>Good leadership has always been defined by what worked yesterday, yet no formal discipline exists to teach you principles for dealing with unanticipated challenges and uncertainty. As you'll learn, leadership is the act of choosing to shape the world, shifting it from its current path. However, there is no single leadership formula precisely because the innovations of leaders are new creations. Instead, we will construct a framework of human action that rests on decades of research in behavioral economics and neuroscience, formalized with the mathematical tools of microeconomics. With this framework, we assess the role and appropriate application of autonomy, character and honor, humility, empathy, resilience, and more. We will also read and consider how the latest self-help and business movements fit within this framework, including "psychological capital" (PsyCap), "Immunity to Change," "Grit," and others. The key takeaway of the course will be a formalization of what it means to be people of action.</p>                                                                                                                                                             |                               | 2027-1 2027-2 2028-2 2029-1                             |

| <p>This course provides an overview of major topics in the study of economic development. It combines the study of economic theories on the determinants of growth and development with a discussion of related and current empirical work. The goal is not to provide exhaustive coverage of all relevant topics, but instead to expose cadets to current issues and debates in the field of development economics. By the end of the course, cadets should be familiar with indicators of growth and development, know seminal theories and be able to assess them in light of empirical evidence, be able to read, understand, and critique current empirical research in economic development, and be able to think innovatively about policy design by drawing on and integrating theoretical and empirical research. Ultimately, cadets will be empowered as future decision-makers to better design, implement, and evaluate policy interventions.</p>                                                                                                                                                                                                                                                                |                               | 2026-1 2028-1 2029-1                                    |

| <p>Investment Theory and Application is designed to give cadets an appreciation of the theoretical underpinnings for investing as well as the way investors think about and approach the markets today. This course pulls from concepts in statistics, microeconomics, econometrics, accounting, and finance. Broadly, the course is organized into three interconnected blocks. Before studying the movement of prices and the measure of risk and return in the markets, investors need to understand how to value (price) a security (stock, bond, or option). After understanding these basic valuation techniques, investors can begin appreciating the relationship between risk and return in the markets and how that builds to some of the foundational theories and models in finance: modern portfolio theory, the efficiency market hypothesis, and the capital asset pricing model. Finally, after building the theoretical story of efficient markets, we will explore the counterpoint. The course concludes with a rigorous final project, where students wade through imperfect information to propose and defend recommendations for the current active portfolio within West Point's Investment Club.</p> |                               | 2026-2 2027-2 2028-2 2029-2                             |

| <p>The purpose of SS464 is to address the complex challenges of homeland security through an interdisciplinary approach. The goal of this course is to provide future leaders with a thorough understanding of the homeland security policy area. This course explores how the evolving nature of the terrorist threat, particularly catastrophic terrorism, poses unprecedented and complex challenges to how America provides for its security. The course examines how homeland security policy intersects with other domestic and foreign policy issues, how our federalist system of government affects homeland security, and how moral, ethical, and civil liberties concerns complicate the development of effective homeland security policies. By analyzing the threat and developing an understanding of the unique policy problems and tools of homeland security, the course enables students to critically assess national efforts in such areas as border</p>                                                                                                                                                                                                                                                 |                               | 2026-1 2026-2 2027-1 2027-2 2028-1 2028-2 2029-1 2029-2 |

security, domestic counterterrorism policy, critical infrastructure protection, and emergency preparedness and response. Students will learn about the major policy and institutional reforms underway in the homeland security policy area, examine whether these changes are improving or will improve U.S. security policy, and develop their own views on the direction of national homeland security policy. The course will enable students to think critically about how the United States' overseas efforts to combat terrorism, preempt emerging threats, and counter the proliferation of weapons of mass destruction relate to domestic homeland security efforts. By the end of the course, students will gain a solid intellectual foundation to think critically and creatively about America's efforts to prevent terrorist attacks within the United States, reduce our vulnerability to terrorist attack, and minimize the damage and recover from attacks that may occur.

**Lessons:** 20 @ 110 min (1.500 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** Admission to the course will be capped with priority given to Terrorism Studies Minor students.

**Prerequisite(s):** SS307  
-Or-

**Scope:** 2019-2

**Offerings:**

The purpose of SS465, is to address the challenges of terrorism in the current and future global security environment through an interdisciplinary approach. Specifically, this course examines the unique challenge terrorism poses to liberal democratic states, policy makers and to military professionals. By analyzing the different perspectives of terrorism, given a variety of political and strategic contexts, students better understand terrorist motivations, strategies, means and ends. Finally, the course explores how a liberal democratic state can best fight terrorism in this new threat environment.

**Scope:** 2019-2

**Offerings:**

The Combating Terrorism course represents a unique opportunity for students to conduct in-depth and integrated study on the most pressing past, present, and future counterterrorism challenges to the United States and its interests. The objectives of this course are: (1) to synthesize and apply the cadet's studies across their core academic major and elective course work to the thematic issue of counterterrorism; (2) to apply methodological skills of research design, conceptual reasoning, analysis, and research gained to counterterrorism; (3) to extend the cadet's in-depth study of the selected area of interest beyond the level obtained in course work with regards to counterterrorism; (4) to design and conduct focused research; and (5) to develop cadet skills in conceptual reasoning, critical analysis, and effective writing.

| <b>SS468</b> | <b>POLITICAL PARTICIPATION</b> | <b>3.0 Credit Hours</b><br>(BS=0.0,ET=0.0,MA=0.0) |
|--------------|--------------------------------|---------------------------------------------------|

---

**Scope:** 2020-1

**Offerings:**

This course provides a broad understanding of the dynamics of political participation. The goals of this course are two-fold. First, it comprehensively examines both individual and group participation, as well as the many ways in which participation manifests itself in the democratic process, namely in the form of electoral (voting, campaigning) and non-electoral behavior ("civicness", group action, etc). As such, this course will include topics in public opinion, the electoral process, and voting behavior. Second, the approach is both empirical - and theoretical. This course examines results of electoral behavior (primarily U.S. national and state elections), complemented with competing theoretical approaches which serve to explain and better understand this behavior.

2027-1 2028-1 2029-1

**Lessons:** 30 @ 75 min (2.000 Att/wk)    **Labs:** 0 @ 0 min

|--------------|------------------------|----------------------------------------------------------|

---

**Scope:** 2022-1

**Offerings:**

This course is designed to teach students advanced concepts in estimation and statistical inference. Building upon the material covered in SS368, students will learn how to test for failure of the data to meet the assumptions of the basic regression model and how to allow for these departures from the standard assumptions during estimation. Among the topics covered will be Generalized Least Squares, Time Series, Instrumental Variables, and Simultaneous Equations estimation. Application of the techniques to the estimation of economic models using actual economic data is an integral part of the instruction. The course makes substantial use of statistical software packages.

|--------------|--------------------------|----------------------------------------------------------|

---

**Scope:** 2020-1

**Offerings:**

SS470 is a senior level economics course whose primary purpose is to provide depth in the student's background and understanding of macroeconomics and international economics. The focus of the course is on the financial sector of the economy, which provides the means to transfer savings from firms, households, and governments to investors who want to purchase new capital goods. The course begins by discussing the various types of financial institutions and examines the importance of financial intermediation. The course then identifies how to measure the risks faced by financial institutions and how to manage these same risks.

2026-1 2026-2 2027-1  
2028-1 2029-1 2029-2

**Lessons:** 30 @ 75 min (2.000 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** The final eight lessons of the course comprise an extended computer banking simulation, allowing cadets to apply the theories from previous lessons.

**Prerequisite(s):** SS388

| <b>SS472</b> | <b>SOLDIER &amp; STATE: AM CIV-MIL RE</b> | <b>3.0 Credit Hours</b><br><b>(BS=0.0,ET=0.0,MA=0.0)</b> |
|--------------|-------------------------------------------|----------------------------------------------------------|

---

**Scope:** 2021-1

**Offerings:**

This seminar explores the unique role of the soldier within our democratic republic. We begin by situating the profession of arms within the Executive branch as an agent to its direct principal, the Legislative branch. We proceed by examining the similarities and differences between the military and other agents of the administrative state. We explore the military's role in providing professional expertise in the policy process and examine current trends that threaten to undermine this advisory position. Using a historical framework, we will examine the evolution of civil-military relations in times of war, peace, and perpetual conflict. We will place particular emphasis on the theories and norms of civil-military relations in a post-9/11 world including navigating the tensions inherent to the dual role of the soldier as war fighter and state builder..

| <b>SS473</b> | <b>AMERICAN FOREIGN POLICY</b> | <b>3.0 Credit Hours</b><br><b>(BS=0.0,ET=0.0,MA=0.0)</b> |
|--------------|--------------------------------|----------------------------------------------------------|

---

**Scope:** 2022-1

**Offerings:**

SS473 examines the historical evolution, development, implementation, and consequences of American foreign policy. It analyzes the actors that craft and influence policy, concentrating both on formal government institutions--such as the President, Congress, and the foreign policy bureaucracy--and informal institutions such as public opinion, political parties, interest groups, and the media. The course examines key events in American Foreign Policy history through the lens of constraints and 'policy choice.' What choices did U.S. foreign policy makers confront? What policies did they choose to implement and why? What were the consequences of those decisions? Students will ultimately apply these lessons as they evaluate historic foreign policy decisions, debate contemporary dilemmas, and contemplate the future of American foreign policy.

**Lessons:** 30 @ 75 min (2.000 Att/wk)

**Labs:** 0 @ 0 min

**Special Requirements:**

Cadets are required to submit a term paper that analyzes a historical event in American foreign policy history.

2029-1

This courses uses the comparative method, in conjunction with political science theory, to explore and explain the wide variation in political institutions around the world. The course devotes significant attention to understanding the most basic institutional characteristic of a state: its regime type. The first portion of the course wrestles with key definitions: what are the defining characteristics of democracies? What are the defining characteristics of dictatorships and other forms of authoritarian rule? How do we understand regimes that do not fall neatly into either category? The second portion of the course explores the causes of regime transitions: when, where, how, and why does democracy emerge? When is democracy likely to collapse? When do dictatorships fail, and what type of regime results? Finally, the course explores the wide array of outcomes that are influenced by a country's political institutions: economic development, inequality, intrastate conflict, and others. As a "Writing in the Major" course for the Institutions, Governance, and Development track of the International Affairs Major, students in SS475 will develop their substantive knowledge of political institutionalism alongside their critical reading and writing skills through a series of developmental writing assignments.

SS476 covers the entire life-cycle of civil conflict from onset, to dynamics, to termination. Through the use of a rich theoretical and empirical literature on conflict and a range of political science methodologies, it examines questions such as: what causes civil wars? Why do certain patterns of violence occur in civil wars? What makes civil wars so hard to end? What is the impact of third parties on termination of civil wars? The course emphasizes the theory and practice of civil war settlement and termination with particular attention to the role of third parties.

2019-2

**Offerings:**

This is a capstone course for the economics major that is designed to integrate microeconomics, macroeconomics, and econometrics. Coursework and classroom discussion require students to apply theoretical concepts and models from the major's toolbox courses, electives, and the core curriculum to policy issues inherent to the provision of national security. The course prepares students to address the broader economic challenges of national security and provides them with a baseline understanding of the economic underpinnings and ramifications of defense policy. Students use relevant databases, econometrics, and the skills they have learned as economics majors to prepare and present term research papers that analyze major defense and public policy decisions.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Scope:** 2019-2

**Offerings:**

This course is taught by a visiting scholar with a distinguished record of academic achievement and professional service in the national security arena. The seminar focuses on topical issues that reflect the professor's area of expertise. Dr. Kori Schake, a former Director of Defense Strategy and Requirements for the National Security Council and presently a distinguished fellow at the Hoover Institution, serves as our current visiting scholar. In the seminar, students take part in detailed discussions, deliver presentations, conduct research, and prepare analytical papers. Students also benefit from guest speakers who share their experiences and expertise with the seminar. Previous Distinguished Professors include General (Retired) Barry R. McCaffrey, former Director of the White House Office of National Drug Control Policy; General (Retired) John Galvin, former commander of SACEUR and noted author; Professor Richard Shultz, Director of International Security Studies at the Fletcher School of Law and Diplomacy; Professor Linda Brady, Director of the School of International Affairs at Georgia Institute of Technology; and Admiral (Retired) Stansfield Turner, former President of the Naval War College and Director of the Central Intelligence Agency.

**Scope:** 2020-2

**Offerings:**

While occasionally individual states in the international system have sought to find the solution to problems that they face alone - be they security-related, financial, social or environmental - the nature of the 21st century's geopolitical issues almost demand a collective, transnational response. But what entity or entities serve to facilitate this transnational cooperation? Enter international organizations, or IOs. This course is centered on introducing students to the landscape of global IOs that exist in the world today. To that end, this course investigates the emergence, purposes, and contemporary statuses of a variety of the major IOs that mark the international relations landscape today. These will include global IOs (like the United Nations, the World Bank, the International Monetary Fund, the World Trade Organization, the International Criminal Court), regional IOs (like the European Union [EU], African Union [AU], and the Association of Southeast Asian Nations [ASEAN]); and a variety of non-governmental organizations (NGOs) (like Doctors Without Borders, Amnesty International, and the International Committee of the Red Cross). The course also assesses the impact and relevance of international organizations as an issue of concern to Army officers and national security professionals.

| <b>SS480</b> | <b>PUBLIC POLICYMAKING PROCESS</b> | <b>3.0 Credit Hours</b><br>(BS=0.0,ET=0.0,MA=0.0) |
|--------------|------------------------------------|---------------------------------------------------|

**Scope:** 2019-2

**Offerings:**

SS480 is the capstone course for American Politics majors in the Social Sciences Department. This course examines the major concepts, theoretical frameworks, and substantive dilemmas of the public policymaking process. The aim of this course is to arm students with a myriad of tools to understand, evaluate, and contextualize specific political problems in the public policy arena. Students will be expected to integrate the concepts of not only basic, toolbox, and elective courses, but knowledge acquired from other courses from other disciplines. Public policy spans the disciplines of politics, economics, sociology, philosophy, and psychology, as policymakers wrestle with developing and implementing value-laden decisions in a world of scarcity and uncertainty. As such, the student of public policy must use a variety of social science tools - and increasingly, physical science tools, to dissect policy problems, develop viable and feasible alternatives, and fashion methods of adoption and implementation. Consequently, this course is designed to build upon the student's conceptual and analytical base in the quest to establish and refine a systematic approach to public policy analysis, formulation, adoption, and implementation.

**Scope:** 2019-2

**Offerings:**

This seminar is a survey of the politics that shape America's policy decisions over war and peace. We study the domestic influences of foreign policy and the international political dynamics that shape why and how America intervenes. It is an examination of American national security policy and institutions using theoretical, historical, and practical perspectives. Drawing from various literatures, we examine and evaluate the choices our nation makes in defense policy decisions. We address questions concerning military innovation and adaptation, change and transition in the armed services, defense resources, and capacities of actors in the defense policy arena. Using the lens of "grand strategy," we examine how defense policy decisions are influenced by a broad and complex array of political and economic factors and how these decisions shape future domestic and foreign policy environments.

**Scope:** 2020-2

**Offerings:**

This course helps cadets to improve their ability to analyze the national security choices of the United States. An underlying premise is that it is useful to think strategically about national security. To think strategically means to keep in mind the need to identify and to reconcile ends, ways, and means when seeking to advance the national interests of the United States. Sound in theory, this approach is hard to implement in practice. This course introduces cadets to actors, processes, and issues that influence US national security decisions and gives cadets a greater appreciation for the challenges associated with making and implementing national security policy.

**Scope:** 2019-2

**Offerings:**

This course integrates economic principles taken in SS382 and SS388. International Economics promotes understanding of the economic causes and effects of international trade, examines the justifications for and effectiveness of a variety of trade policies, explains and critiques the international flow of money, and explores the impact of these topics upon individual firms in the marketplace. The course's methodology rests on theoretical concepts and models such as profit maximization, market equilibrium, preference maximization, and macroeconomic equilibrium. The course is divided into four blocks. The first three blocks investigate the theory of international trade in goods and comparative advantage, the practice of international trade and international political economy, and the workings of international monetary markets. The final block compels cadets to apply their estimates of the international macroeconomic environment to choices made by national governments.

This is a discussion-based seminar course designed to survey the origins and dimensions of contemporary issues within the post-colonial, sub-Saharan African state. The concepts of democracy, institutionalization, political economy, war, and peace remain a complex landscape for many African states. Focusing on theoretical work and case studies, cadets will examine sub-Saharan Africa's historical experiences, its economic heritage, and the international context in which it is embedded. At the same time, cadets will explore how Africans have shaped their own political and economic situations. Using social science methods, cadets will gain an understanding of how context shapes political behavior, in general, and how historical and political forces have influenced African politics, in particular.

|---------------|--------|-------------------|

SS486 examines states and state building in the modern world. Whether one focuses on international relations, comparative politics, or American politics, the state remains a critical component to our understanding of political life. Cadets in this course engage a robust theoretical literature that forms the foundation for an understanding of contemporary and future state building efforts. Throughout the course, we explore major theories of state formation such as warfare, economic development, and institutions. Next, the course adopts the view of the state and investigates a critical challenge confronting civilian and military leaders - why do some states become strong and others weak? Subsequently, we adopt the view of the civil society and examine state building dynamics from the vantage of those whom the state seeks to rule. Finally, the course examines how the state building project functions around the world through a variety of regional case studies. Cadets completing this course join a small but critical set of military officers prepared to lead and advise the next state building project.

| <b>Scope:</b> | 2020-2 | <b>Offerings:</b> |
|---------------|--------|-------------------|

SS487 serves as an introduction to the complex and fascinating fundamental relationships between politics, economics, and society at the international and domestic levels. How do political institutions, actors, and policies shape international economic phenomena? And how do these economic phenomena influence political forces in turn? Though international political economy falls within the broader subfield of international relations, we will soon discover that domestic politics and economics cannot be separated from international political economy. Thus, students will explore the mechanisms that link politics and economics across a variety of issues that are central to the field of IPE, including the politics and economics of trade, economic development, international monetary affairs, and emerging challenges in the global economy.

**Lessons:** 30 @ 75 min (2.000 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** At the discretion of the current course director.

**Prerequisite(s):** SS307

| <p>The course provides an environment that is conducive to independent effort in a subject area of special interest to the cadet. Original research or specialized study will be accomplished in the field of American Politics. The course is conducted in three phases. First, the cadet and the individual tutor from the Social Sciences faculty will reach agreement on a subject area for research. Research methods will be studied under the direction of the faculty member. Research may involve field trips and personal interviews with experts in the area of study. In the second phase, the cadet will engage in independent research and prepare a draft analytical paper or report detailing the findings. During this period, frequent consultation with the faculty advisor occurs regarding the progress in the project. In the third phase, the cadet will present and defend the findings before a faculty committee. This course is the first in a two-part thesis program in the fall and encompasses individual projects in the spring.</p> |                                                       | 2026-1 2027-1 2028-1<br>2029-1             |

| <p>The course provides an environment that is conducive to independent effort in a subject area of special interest to the cadet. Original research or specialized study will be accomplished in the field of International Affairs. The course is conducted in three phases. First, the cadet and the individual tutor from the Social Sciences faculty will reach agreement on a subject area for research. Research methods will be studied under the direction of the faculty member. Research may involve field trips and personal interviews with experts in the area of study. In the second phase, the cadet will engage in independent research and prepare a draft analytical paper or report detailing the findings. During this period, frequent consultation with the faculty advisor occurs regarding the progress in the project. In the third phase, the cadet will present and defend the findings before a faculty committee. This course is the first in a two-part thesis program.</p>                                                           |                                                       | 2026-1 2026-8 2027-1<br>2028-1 2029-1      |

| <p>This course is the first phase of the Senior Thesis in Economics sequence and offers cadets an opportunity to develop their research skills, through a combination of lectures and tutorial-style guided independent study, with the goal of preparing for the Senior Thesis in Economics. Cadets will develop economic research projects from the idea-phase through the literature review, data acquisition/analysis, and writing phases in an iterative process of producing intermediate drafts of project components and receiving instructor feedback. This will culminate in an initial draft of their senior thesis project. At the same time, lectures and assignments will cover various topics related to economic research, including strategies for generating research ideas, writing in economics, programming in STATA, data management strategies, and common empirical approaches for causal inference.</p>                                                                                                                                     |                                                       | 2026-2 2027-2 2028-2<br>2029-2             |

| The colloquium provides cadets an opportunity for reading and analysis in depth in a topic area of special interest and timely relevance to their concentration. The course employs the seminar approach in which the instructor meets with small groups to discuss assigned readings, and cadets present their own analyses to the group. Course directors develop topics and determine the semesters in which they will be offered. Department Academic Counselors then forward course offerings and descriptions to Social Science majors and those majoring in areas related to the colloquium topic.                                                                                                                                                                                                                                                                |                                                                                                                                                                | 2026-1 2027-2 2029-1                               |

| The colloquium provides cadets an opportunity for reading and analysis in depth in a topic area of special interest and timely relevance to their concentration. The course employs the seminar approach in which the instructor meets with small groups to discuss assigned readings, and cadets present their own analyses to the group. Course directors develop topics and determine the semesters in which they will be offered. Department Academic Counselors then forward course offerings and descriptions to Social Science majors and those majoring in areas related to the colloquium topic.                                                                                                                                                                                                                                                                |                                                                                                                                                                | 2026-2                                             |

| The colloquium provides cadets an opportunity for reading and analysis in depth in a topic area of special interest and timely relevance to their concentration. The course employs the seminar approach in which the instructor meets with small groups to discuss assigned readings, and cadets present their own analyses to the group. Course directors develop topics and determine the semesters in which they will be offered. Department Academic Counselors then forward course offerings and descriptions to Social Science majors and those majoring in areas related to the colloquium topic. Topics will vary by year but recent SS490 colloquiums include: Nationalism and Ethnic Conflict; Politics and Film; the Politics of Intelligence; Politics and Government of South and Southeast Asia; Philosophy, Religion, and Terror; and Winning the Peace. |                                                                                                                                                                | No Course Offerings                                |

| SS491 is one of three capstone courses that cadets may choose to take in their senior year to serve as the integrative experience within the International Affairs Major. In SS491, cadets will be placed into small groups under the direction of a faculty member to complete an in-depth research project based on cadet research interests. Research projects may be oriented toward the needs and interests of an external "client" organization in the government, civilian academia, or the private sector. In addition to producing a written research report, each research group will present their projects to the West Point community and, if applicable, to the external client organization or other audiences.                                                                                |                                                                                                                                                                | 2026-2 2027-2 2028-2<br>2029-2                     |

| This course is taught by the Bernard Rogers Distinguished Professor of Defense Economics, a scholar with a distinguished record of academic achievement and professional service in the arena of Defense Economics. This course is focused on topical issues that allow students to benefit from the specific expertise of the Rogers Chair. Students typically take part in seminar discussions, conduct research, and prepare analytical papers. Potential topics are Army procurement policy, contract design, the growth of military technology, the Department of Defense budget process, and corporate finance in the defense sector.                                                                                                                                                                   |                                                                                                                                                                | No Course Offerings                                |

| This course provides cadets an opportunity for reading and analysis in depth in a topic area of special interest and timely relevance to their concentration. The course employs the seminar approach in which a senior faculty member meets with small groups to discuss assigned readings, and cadets present their own analyses to the group. Course directors develop topics and determine the semesters in which they will be offered. Department Academic Counselors then forward course offerings and descriptions to Social Science majors and those majoring in areas related to the senior studies topic. Topics will vary by year but recent senior studies include: Politics of Race, Gender, Sexuality and Politics, Studies in Grand Strategy, State and Local Politics, and Judicial Politics. |                                                                                                                                                                | 2026-2 2027-2 2028-2<br>2029-1                     |

This course provides cadets an opportunity for reading and analysis in depth in a topic area of special interest and timely relevance to their concentration. The course employs the seminar approach in which a senior faculty member meets with small groups to discuss assigned readings, and cadets present their own analyses to the group. Course directors develop topics and determine the semesters in which they will be offered. Department Academic Counselors then forward course offerings and descriptions to Social Science majors and those majoring in areas related to the senior studies topic. Topics will vary by year but recent senior studies include: Politics of Race, Gender, Sexuality and Politics, Studies in Grand Strategy, State and Local Politics, and Judicial Politics.

**Lessons:** 30 @ 75 min (0.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** One research paper (minimum length of twenty typed, double-spaced pages).

**Prerequisite(s):** SS360 SS386

|--------------|------------------------------|----------------------------------------------------------|

---

**Scope:** 2019-2

**Offerings:**

This course applies economic principles to the financial decisions that businesses make every day, and to the capital markets in which households and firms interact. The course covers topics including project analysis using net present value techniques, risk and return of assets and projects, efficient capital markets, corporate capital structure and dividend policy, and valuation of assets. Cadets will learn methods to analyze individual projects as well as business enterprises as a whole. As the U. S. Military continues to privatize many functions, knowledge of techniques used by corporations is becoming essential for our future Army leaders. This course is the second of a two-course financial economics sequence for which SS394 ? Financial Statement Analysis is a prerequisite, except for cadets with permission of the instructor.

2026-1 2026-8 2027-1

---

**Scope:** 2020-2

**Offerings:**

SS495 is one of three capstone courses that cadets may choose to take in their senior year to serve as the integrative experience within the International Affairs Major. In SS495, a senior faculty member in the International Affairs Program will develop an in-depth exploration of a selected topic to present to cadets in a seminar format. As cadets study the course material and pursue an individual research project relating to the seminar theme, they will draw on and integrate the skills and knowledge learned in previous core, major, and CSC courses.

2026-2 2027-2 2028-2  
2029-2

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** At the discretion of the current course director.

| <p>This course is taken in the spring term of the senior year and comprises the second and final phase of the Senior Thesis in American Politics. Cadets enrolled in SS498A normally will complete SS489A Senior Research Seminar in American Politics in the fall semester of their senior year, where they will complete a prospectus, literature review, annotated bibliography, outlines, and initial draft of their senior thesis. In SS498A, students will continue work on an independent study basis with their thesis advisor and committee, conducting further research and updating drafts to produce a final written thesis product generally ranging from 30-50 pages in length. Students defend their thesis before a committee in the last two weeks of classes.</p>         |                                                                                                | 2026-2 2027-2 2028-2<br>2029-2             |

| <p>This course is taken in the spring term of the senior year and comprises the second and final phase of the Senior Thesis in International Affairs. Cadets enrolled in SS498B normally will complete SS489B Senior Research Seminar in International Affairs in the fall semester of their senior year, where they will complete a prospectus, literature review, annotated bibliography, outlines, and initial draft of their senior thesis. In SS498B, students will continue work on an independent study basis with their thesis advisor and committee, conducting further research and updating drafts to produce a final written thesis product generally ranging from 30-50 pages in length. Students defend their thesis before a committee in the last two weeks of classes.</p> |                                                                                                | 2026-2 2027-2 2028-2<br>2029-2             |

This course is taken in the spring term of the senior year and comprises the second and final phase of the Senior Thesis in Economics sequence. Cadets enrolled in SS498C normally will have completed SS489C Research Methods in Economics, where they will have developed a promising initial draft of their senior thesis. In SS498, students will continue work on an independent study basis with their thesis advisor and committee, conducting further research and updating drafts to produce a final written thesis product generally ranging from 25-50 pages in length. Students defend their thesis before a committee in the last two weeks of classes.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Cadets must receive approval from their major's Program Director in order to enroll in SS498C.

**Prerequisite(s):** SS489C  
-Or-  
SS489

**Disqualifier(s):** SS498

|--------------|----------------------------|----------------------------------------------------------|

---

**Scope:** 2024-2 **Offerings:**

This course considers the role of ambition in a good life, how the best-laid plans of ambitious individuals sometimes go wrong, and how leaders in all fields of human endeavor can balance ambition and humility to set goals that are both lofty and achievable, while responding properly to setbacks and failure. Students engage these and related questions through close study of a single text in a small seminar setting. The text for each year's course will be selected by the professor offering the seminar; it will in each case be a fundamental text from the professor's field that has had a decisive impact on his or her development. In the culminating assignment, students write an essay describing how, in light of the lessons they have learned from the work they have studied, they intend to improve their own character and the world around them.

**Lessons:** 15 @ 75 min (1.000 Att/wk)      **Labs:** 0 @ 0 min

**Scope:** 2022-1 **Offerings:**

The purpose of XH300 (formerly XH497) is to improve cadets' ability to evaluate complex issues involving ethical judgements and choice among scarce resources, reach reasoned positions on these issues, and effectively argue their positions verbally and in writing. The process of pursuing this goal will make cadets better officers, scholars, and citizens. The course will employ several methods to assist in this pursuit. First, it will achieve breadth by focusing on current issues from a variety of fields, examining the "hard choices" that confront society, government, military leaders, and individual citizens. Among the disciplines from which the course will draw are Philosophy, Law, Political Science, Economics, Physics, Biology, and English. Each cadet will also be assigned an individual mentor from among the faculty of the Departments of Social Sciences, History, Law, or English. Requirements include a briefing on a current issue in the cadet's major field, a book review, and a personal statement summarizing academic and other goals.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Admission to the course requires an interview and the approval of the department head.

|--------------|-----------------------------------|----------------------------------------------------------|

---

**Scope:** 2022-7 **Offerings:**

The Grand Strategy Field Study AIAD experience provides the opportunity to apply theories of grand strategy to real-world historical and contemporary events. Through travel to a place of grand strategic importance - whether the ruins of the Athenian Empire, the decisive battlefields of World War II, or such new arenas of Great Power competition as the Indo-Pacific - cadets will gain a deep first-hand understanding of the geopolitical, cultural, economic, and technological factors shaping grand strategy throughout history and in the present day. Scope, depth, and material covered will satisfy the requirement of a 3-credit hour course in the Grand Strategy program.

**Scope:** 2023-1 **Offerings:**

The purpose of XH407 Vision and Rhetoric is to build upon the foundation of critical thought established in XH300 Purpose. Cadets apply the concepts developed in XH300 to contemporary issues facing the United States Army, Department of Defense, Nation, and wider world. Cadets continue to refine their understanding of their place in the society and develop skills to convey this sense of self to others, both verbally and in writing. Cadets will continue to be advised by both Department of Social Sciences faculty and academic advisors in their home departments.

**Offerings:**

This tutorial employs one-on-one or small group discussions to examine selected texts from the period of the American founding utilizing diverse disciplinary perspectives. In consultation with a faculty supervisor, cadets select an area of focus (e.g., Tom Paine's Common Sense, the Declaration of Independence, the Constitution, etc.) as the basis for a tailored reading program. Areas of focus may vary year to year in accordance with student interest and faculty expertise. The course meets for approximately 750 minutes (10 meetings x 75 minutes) and concludes with an oral examination by a committee of faculty members representing different disciplines.

**Offerings:**

For cadets attending foreign military academies and academic institutions. Instruction may be in English or a foreign language. Cadets will attend classes and produce papers and other academic work as required by the course instructor and the institution's academic requirements. This class serves as the equivalent to a foreign course covering the politics, societies, and structures of states in different regions of the world. The course also covers the study of the relationship between the state and society in these regions. Regions include--but are not limited to--the Middle East, East Asia, Southwest Asia, Central Asia, North Africa, South Africa, Latin America, South America, and Europe.

---

**Scope:** 2020-1

**Offerings:**

For cadets attending foreign military academies and academic institutions. Instruction may be in English or a foreign language. Cadets will attend classes and produce papers and other academic work as required by the course instructor and the institution's academic requirements. This class serves as the equivalent to a foreign course about international regimes, international institutions, and / or international organizations and the structure, role, and relevance of these actors in the international system. In addition, course content may include material about the relationship between international organizations and institutions and states. International organizations and institutions studied may include--but are not limited to--the United Nations, NATO, the European Union, International Economic Organizations, the International Criminal Court, and the Kyoto Protocol / other Climate Change Institutions.

2026-8 2026-9 2027-8  
2027-9 2028-8 2028-9  
2029-2 2029-8 2029-9

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

| For cadets attending foreign military academies and academic institutions. Instruction may be in English or a foreign language. Cadets will attend classes and produce papers and other academic work as required by the course instructor and the institution's academic requirements. This class serves as the equivalent to a foreign course covering the development, implementation, and consequences of American foreign policy. It analyzes the actors who make American foreign policy, concentrating both on government sources such as the President, Congress, and the foreign policy bureaucracy, as well as external sources such as public opinion, interest groups, and the media. Topics include - but are not limited to - U.S. relations with China, Russia, and the European Union, energy politics, the Arab-Israeli crisis, weapons of mass destruction and rogue states, terrorism, democracy promotion, and the global response to US foreign policy. In exploring each of these current challenges and dilemmas, this course attempts to understand the policies and strategies the U.S. utilizes to secure its interests and achieve its objectives. |                                       | No Course Offerings                                                            |

| For cadets attending foreign military academies and academic institutions. Instruction may be in English or a foreign language. Cadets will attend classes and produce papers and other academic work as required by the course instructor and the institution's academic requirements. This class serves as the equivalent to a foreign course covering the history and development of state social structures, political cultures, and systems and structures of government. Topics include, but are not limited to, democratization, regional anthropology, and conflict resolution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                       | 2026-8 2026-9 2027-8<br>2027-9 2028-8 2028-9<br>2029-1 2029-2 2029-8<br>2029-9 |

**Scope:** 2019-2

**Offerings:**

For cadets attending foreign military academies and academic institutions. Instruction may be in English or a foreign language. Cadets will attend classes and produce papers and other academic work as required by the course instructor and the institution's academic requirements. This class serves as the equivalent to a foreign course about international economic systems, international institutions, and / or international organizations and the structure, role, and relevance of these actors in the global economic system. In addition, course content may include material about the relationship between international organizations and institutions and states. International organizations and institutions studied may include - but are not limited to - the United Nations, World Bank, International Monetary Fund, the European Union, World Trade Organization, the Bretton Woods system and International Financial Organizations. Topics include - but are not limited to - international political economy, economic development, regional economics, and the history of the modern international economic system.

|--------------|--------------------------------------|----------------------------------------------------|

---

**Scope:** 2019-2

**Offerings:**

For cadets attending foreign military academies and academic institutions. Instruction may be in English or a foreign language. Cadets will attend classes and produce papers and other academic work as required by the course instructor and the institution's academic requirements. This class serves as the equivalent to a foreign course about international and foreign financial systems, international accounting and foreign business practices. In addition, course content may include material about the relationship between businesses, institutions and states in foreign countries. Topics include--but are not limited to--corporate finance, financial statements and accounting, currency issues, central banking, and commercial and retail banking.

| <b>Scope:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 2017-1                                                                                                                                       | <b>Offerings:</b>                                                                                                    |
| <p>This course prepares cadets to consider the economic dimension in the evaluation of engineering alternatives; a consideration vital to the Systems Decision Process, engineering management, systems acquisition and many other application areas. While emphasis is on the analytical consideration of money and its impact on the areas above, the course also incorporates professional ethics in the engineering economic analysis process. The course is taught in four lesson blocks. The Time Value of Money (TVM) block -includes the quantitative methods for economic analysis of engineering alternatives by introducing cost concepts, interest concepts, the cash flow diagram and developing interest formulas. The Analysis Methods block develops techniques for project evaluation and comparison and ways to account for risk and uncertainty. The After Tax Cash Flow block incorporates the real-world effect of taxes, depreciation and inflation into the analysis methods. The Capital Budgeting block completes a comprehensive introduction to engineering economy by introducing the concept of economic service life and project financing. A one lesson introduction to personal finance is included to demonstrate how many of the concepts used in the business world can also be applied for personal planning. Course concepts are applied using Excel in both graded and ungraded labs. Cadets will spend several lessons in a computer lab environment.</p> |                                                                                                                                              | 2026-1 2026-2 2026-3<br>2027-1 2027-2 2028-1<br>2028-2 2029-1 2029-2                                                 |

| <p>EM384 focuses on the application of deterministic and probabilistic models used by analysts to make engineering and management decisions. Cadets learn to apply various modeling techniques to represent and solve real-world organizational problems in the military and industry. Topics include: linear and integer programming, network modeling, decision making under uncertainty, and simulation modeling. Cadets apply concepts and tools using Microsoft Excel in a variety of computing environments. The techniques taught in this course have been applied to an increasingly wide variety of complex problems in business, government, military, health care, and education. Ethical responsibilities in describing the results of analyses to decision makers are integrated throughout the course. Cadets make innovative use of spreadsheets to develop and analyze models. Cadets are tested on the application of course concepts from the five blocks of instruction during four graded labs, four problem sets, and a comprehensive term-end exam.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                              | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2027-3<br>2027-8 2028-1 2028-2<br>2028-3 2028-8 2029-1<br>2029-2 2029-4 2029-8 |

**Scope:** 2019-2

**Offerings:**

This course develops skills required to lead an organization to the achievement of their objectives through the proper application of the management of planning, implementing and controlling the organization activities, personnel and resources. The course focuses on the Implementation phase of the Systems Decision Process (SDP). Topics include project selection, roles and responsibilities of the project manager, planning the project, budgeting the project, scheduling the project, allocating resources to the project, monitoring and controlling the project, evaluating and terminating the project, risk assessment and management, organizational structure and human resources. Case studies illustrate problems and how to solve them. Course assignments are designed to help students learn and apply project management techniques taught in the course. The class design project will provide students with the opportunity to integrate project management software, Microsoft Project, into the preparation of an Engineering Management Project Plan.

**Scope:** 2020-1

**Offerings:**

This course deals with the quantitative aspects of design and analysis of production operations management. Emphasis is on identification, analysis, and solution of production problems using applied quantitative techniques. Practical exercises reinforce the problem-solving techniques necessary for today's successful military and civilian engineering managers and systems engineers. Specific methods and techniques taught and applied are operations strategy, product design and selection, total quality management, capacity planning, facility location, facility layout, work system design, lean systems and scheduling. This course is required for those pursuing the Engineering Management major and an elective for the Systems Engineering, Systems and Decision Sciences, Management and other engineering majors.

**Scope:** 2020-2

**Offerings:**

Cadets learn and explore discrete event simulation techniques and tools used to analyze and improve complex systems. Applications include operations, transportation, manufacturing and logistics systems. Topics include functional modeling with functional flow diagrams, simulation theory, the modeling process, input data analysis, generation of random numbers, verification and validation of simulation models, experimental design, output analysis, and application using simulation software. The course concepts provide cadets the tools to evaluate military and civilian systems. Emphasis is placed on using simulation in the Systems Decision Process (SDP). Cadets demonstrate proficiency and develop communication skills through design projects and briefings. Cadets spend several lessons in a computer lab environment.

| <p>This course teaches cadets the strategic importance of supply chain design, planning, operation, business processes, and information management systems. Cadets will become familiar with engineering a supply chain network---from conducting inventory management to establishing proper sourcing and transportation strategies to understanding capacity and facility locations to constructing the proper information technology framework needed to be successful. Cadets will develop the ability to evaluate how information flows can be a substitute for the stock of physical resources. Additionally, cadets will understand why such information systems succeed or fail through the explanation of concepts, insights, practical tools and the information technology that supports decision making. This course will focus on understanding the key drivers of a supply chain such as inventory, facilities, transportation, sourcing, pricing, and information. Cadets will also learn to assess the impact of strategic alliances and globalization on supply chain strategies and best practices, to include smart pricing, customer value, and new product and supply chain design.</p>                                                                                                                                            |                                         | 2026-2 2027-2 2028-2 2029-2                                                                                                   |

| <p>SE301 serves as the "roadmap" course for all cadets taking the Engineering Management, Systems Engineering, or Systems &amp; Decision Sciences majors as well as all cadets enrolled in the Core Engineering Sequence. This course presents the methodological framework and techniques for designing, implementing, managing and reengineering complex systems or processes. Cadets learn engineering design and engineering management processes and gain an appreciation for future environments and system life-cycles. Cadets analyze case studies and complete practice problems to illustrate mastery of course topics. Cadets also use spreadsheet software for modeling and analyzing design alternatives. SE301 introduces a Systems Decision Process while incorporating material from courses in the USMA core curriculum and also previews the modeling and decision making tools that cadets will learn in follow-on Department of Systems Engineering courses. The course is designed to allow Cadets the opportunity to learn engineering design and engineering management processes on an individual level so that each Cadet will have the experience necessary to succeed in future Systems Engineering courses. Cadets will spend a number of lessons in a computer lab environment.</p>                                        |                                         | 2026-1 2026-2 2026-5 2026-8 2027-1 2027-2 2027-5 2027-7 2027-8 2028-1 2028-2 2028-5 2028-7 2028-8 2029-1 2029-2 2029-5 2029-8 |

| <p>SE302 prepares students to effectively model, analyze, and understand complex, interdisciplinary, and ill-defined problems as systems so they can design and implement effective solutions. The course covers principles and methods for requirements management, functional and nonfunctional analysis, risk management, testing, cost estimation, and technical system architecture from industry and DoD including IDEF0 modeling, the Systems Modeling Language (SysML), and the Department of Defense Architectural Framework (DoDAF). The Engineering Vee model is used as a framework throughout the course. The course also includes a review of Model-Based Systems Engineering (MBSE) methodologies. The techniques taught in this course have been applied to an increasingly wide variety of complex, ill-defined problems in business, government, military, health care, and national capacity development. Ethical responsibilities in describing the results of analyses to decision makers are integrated throughout the course. Cadets develop communication skills through written reports and presentations. A course project will challenge cadets to apply their modeling and analysis skills to a real world complex, ill-defined problem in political, military, economic, social, cultural, and informational contexts.</p> |                                         | 2026-1 2027-1 2028-1 2029-1                                                                                                   |

| Cadets learn how to use information and technology in support of systems decision-making. They learn how to manipulate data in spreadsheets as well as through a computer language (R) to support decisions. The course introduces cadets to several types of exploratory data analysis to include numeric, text, relational, and geospatial. Cadets learn how to manage analysis in both the traditional and cloud environments, as well as the tradeoffs associated with working in each. Communication skills are developed through both written and oral projects and development of interactive graphical presentations. Cadets will spend most lessons in a computer lab environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                 | 2026-2 2026-8 2027-2<br>2027-9 2028-2 2028-9<br>2029-1 2029-2 2029-8<br>2029-9 |

| This course is an integral part of the Systems Engineering major that emphasizes both the statistical analyses of data and a statistical methodology important to systems analysis and design. The over-arching course goal is to develop cadets into critical consumers and providers of statistical information as it relates to the techniques, activities, and modeling applications that typify systems engineering concerns.. The course builds on the core probability and statistics course and introduces statistics applications fundamental to the design and analysis of simulations and engineering systems. Specific topics include point and interval estimation, parametric and non-parametric tests of hypotheses, analysis of variance, linear regression, and survey design of experiments, specifically analysis of power and determination of sample size. The course emphasizes the importance of knowing and understanding the assumptions associated with the use of inferential statistics as well as the usefulness of statistical software packages. The basic principles learned in this course will facilitate data analysis in support of Army acquisition and system redesign decision-making. Ethical implications in the analysis and presentation of experimental results, as well as interactions with decision makers, are addressed. |                                                                                                                                 | 2026-1 2027-1 2027-8<br>2028-1 2028-8 2029-1<br>2029-2                         |

| The course presents basic techniques of decision-making concentrating on both theoretical and modeling aspects. This course develops innovative systems engineers who can integrate the art and science of decision making for single and multiple objective environments to support the Decision Making phase of the Systems Decision Process (SDP). The focus of the course is modeling problem structure, uncertainty, risk and preference in the context of decision-making. Topics include mathematical foundations and axioms of decision analysis, influence diagrams, decision trees, simulation, sensitivity analysis, subjective probability assessments, value of information, classification of risk attitude given uncertainty. Cadets will also use value focused thinking to support decisions in multiple objective and resource allocation environments. A series of several computer laboratory exercises provides a key bridge between the mathematical theory and the application of skills to open-ended decision problems. Communication skills are developed with both written reports and oral presentations.                                                                                                                                                                                                                                     |                                                                                                                                 | 2026-2 2026-8 2027-2<br>2027-8 2028-2 2028-8<br>2029-1 2029-2 2029-8           |

**Scope:** 2020-2

**Offerings:**

This course is the first of a two-course sequence that emphasizes modeling and analysis of real-world systems. This course focuses on techniques without consideration of uncertainty or probabilistic effects. The course introduces modeling concepts, scale and measurement principles, mathematical analysis methods, and computational approaches used by systems engineers, operations researchers, and management professionals to support systems design and the Systems Decision Process (SDP). Emphasis is placed on creative application of these topics including system representations, problem formulation, solution methods, analysis of results, and interpretation. Topics include axiomatic design, modularity, value function creation, linear programming, sensitivity analysis, networks, transportation models, and human-systems integration assessment. Cadets will spend several lessons in a computer lab environment.

**Scope:** 2020-2

**Offerings:**

This course is the second of a two-course sequence that emphasizes modeling and analysis of real-world systems. Building on the systems modeling approaches introduced in SE387, this course introduces uncertainty into design, modeling, parameter estimations, and data as they effect many of the classical stochastic models used by systems engineers, operations researchers and management professionals to capture and describe quantitative effects of uncertainty on systems design and analysis, and on decision-making as part of the Systems Decision Process (SDP). Topics include stochastic value modeling, law of averages, reliability, realization analysis, Bayesian updating, conditional probability models, and simulation. This course prepares cadets for the quantitative reasoning and analysis techniques required in follow-on courses, including SE481, EM484, SE485 and SE402/403. Cadets will spend several lessons in a computer lab environment.

| This seminar course for SE and EM majors meets to discuss important aspects of the engineering profession to include engineering ethics, licensing procedures, and professional development plans. The seminar also includes presentations by guest lecturers from the military, DoD industrial base, and academic communities. Further, this seminar helps prepare Cadets for the Fundamentals of Engineering Exam.                                                                                                                                                                                                                                         |                                                                                                                                                                                                                      | 2026-2 2027-2 2028-2 2029-2                        |

| Systems Design and Management I is the first course in a two-semester capstone experience for Systems Engineering, Engineering Management, Systems and Decision Sciences, and Operations Research majors. SE402 integrates the principles, concepts and models explored in previous core and engineering topic courses. The course applies the principles of systems design, engineering management, and/or reengineering to a real-world system. Cadets work under the supervision of a faculty member to address a problem presented by a real-world client, providing them an integrative experience for their education in engineering design.           |                                                                                                                                                                                                                      | 2029-1                                             |

| Systems Design and Management I is the first course in a two-semester capstone experience for Systems Engineering, Engineering Management, Systems and Decision Sciences, and Operations Research majors. SE402 integrates the principles, concepts and models explored in previous core and engineering topic courses. The course applies the principles of systems design, engineering management, and/or reengineering to a real-world system. Cadets work under the supervision of a faculty member to address a problem presented by a real-world client, providing them an integrative experience for their education in engineering design.           |                                                                                                                                                                                                                      | 2026-1 2027-1 2027-8 2028-1 2028-8                 |

| Systems Design and Management II is the second course in a two-semester capstone experience for Systems Engineering, Engineering Management, Systems and Decision Sciences, and Operations Research majors. SE403 integrates the principles, concepts and models explored in previous core and engineering courses. The course applies the principles of systems design, engineering management, and/or reengineering to a real-world system of direct concern to a real-world client. Cadets work under the supervision of a faculty member to continue work on the same project begun in SE402, culminating the integrative experience in their education. |                                                                                                                                                                                                                      | 2029-2                                             |
| <b>Lessons:</b> 30 @ 160 min (2.000 Att/wk)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>Labs:</b> 0 @ 0 min                                                                                                                                                                                               |                                                    |

SE440 focuses on preparing students to effectively model, analyze, and understand complex systems in an effort to design and implement effective solutions. The course covers principles and methods for Model-Based Systems Engineering (MBSE) and Digital Engineering. The course will apply tools for technical system architecting from industry and DoD including the Systems Modeling Language (SysML) modeling and the Department of Defense Architectural Framework (DoDAF). Cadets apply concepts and tools using advanced modeling software which includes Enterprise Architect. Ethical responsibilities in describing the results of analyses to decision makers are integrated throughout the course. Cadets develop communication skills through two written reports and make innovative use of modeling packages to develop and analyze systems. A course project will challenge cadets to apply their modeling and analysis skills to a real-world complex system. \*\*\*Pending ABET-PEV review of ET=3.0CR\*\*\*

2029-1 2029-2

This course is the third course of the three-course systems engineering sequence. The course serves as the culminating systems engineering experience for non-engineering cadets and integrates the principles, concepts, and models explored in previous courses. Cadets apply the Systems Decision Process to devise problem solutions that are effective and adaptable. Cadets work in groups to complete a culminating engineering design experience involving the solution of an incompletely defined problem with no single correct answer. Cadets must consider the economic, political, social and ethical constraints of the system and use creativity to generate potential design alternatives. Cadet groups will use models to analyze the alternative solutions and make a recommendation based on economic analysis and system performance. The course requires assessment of the recommended solution and a written plan for implementation.

**Scope:** 2020-2

**Offerings:**

This course explores the theoretical and practical issues in combat modeling and simulation - the study of combat systems, tactics, and the battlefield environment in conflicts between opposing forces. The course focuses on models and algorithms used in state-of-the-art combat simulations, and techniques for analyzing their effects. Major topics of investigation include the model development process, combat attrition models, combat methodologies, analysis of human performance data, verification and validation, and measures of effectiveness. Cadets learn to manipulate 3D visual and system characteristic databases to build and test virtual prototypes of new combat system designs. Application of design of experiments and statistical analysis methods assist cadets in assessing the effectiveness of weapons systems, doctrine, and tactics on the future battlefield. The cadet can apply the concepts learned in this course to evaluate potential new Army combat systems, force structures, or doctrinal changes. The techniques taught in this course are a significant part of the Systems Decision Process (SDP) as they encourage creative and independent thought that applies mathematical, physical, and computer sciences to solve future technological problems. Ethical implications in the development and use of combat models also are discussed.

**Offerings:**

This is a tutorial course in which an individual cadet or a group of cadets study in depth an advanced topic in systems engineering or engineering management under the direct mentorship of a faculty advisor. The scope of the course is tailored to the desires of the cadet(s) in consultation with a faculty advisor. Cadets will coordinate with a faculty mentor who has an interest and background in the research area and who will assist in scoping and developing course content. Communication skills are developed and assessed through both written reports and oral presentations.

**Scope:** 2008-2

**Offerings:**

This course provides in-depth study of a special topic or topics in systems engineering or engineering management not offered elsewhere in the USMA curriculum. This course is intended to broaden a cadet's or group of cadets' exposure to the systems engineering or engineering management discipline. The Department of Systems Engineering visiting professor or senior faculty member assigned to the course is responsible for developing the course topic or topics and advertising the course to prospective cadets.

**Scope:** 2008-1

**Offerings:**

The cadet, or cadet team, integrates the concepts and techniques learned in previous Systems Engineering or Engineering Management courses to solve a current problem of interest to the Academy, the Department of the Army, or other agencies in the Department of Defense. Subject to approval from the course and program directors, cadets may select project topics which are follow-on research from their summer AIAD experience, a topic of interest to them, or one that is compatible with on-going research within the Department of Systems Engineering and/or the Operations Research Center of Excellence. Cadets will coordinate with a faculty mentor who has an interest and background in the research area and who will assist in scoping the project and directing the research effort. Cadets may work individually or in small teams, depending on the nature of the research. The course will culminate with a student presentation and a written report.

| This course offers the opportunity for cadets to receive academic credit for study and/or work completed during the Academic Individual Advanced Development (AIAD) program. The content of the course and the nature of academic credit will be determined by the Head of Department in consultation with the cadet and the summer host agency. Communication skills are developed with both written reports and oral presentations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                          | No Course Offerings                        |

| Simulation modeling can be used to study the effects of changes to existing systems or processes, or evaluate the performance of new systems prior to their implementation. The techniques taught in this course are a significant part of the Systems Decision Process (SDP) as they introduce the concept of dynamic systems thinking and analysis. By their nature, large scale systems are dynamic. These systems involve complex cause and effect relationships that form feedback loops between the variables of interest. These systems produce outcomes that are not always intuitive. The cadets use the properties of dynamic systems and analytical techniques to design continuous models of complex systems or processes, implement these models, and perform an analysis of the results. Topics include applications of System Dynamics, client/modeler relationships, problem articulation, functional modeling through causal loop diagrams and stock and flow diagrams, modeling and simulation in a PC-based continuous event simulation package, policy design, policy testing, and policy implementation. These concepts and principles are applied to military and civilian applications such as physical systems, human decision processes, population, and economic/business processes. Cadets develop communication skills by presenting their design results in both written reports and oral presentations. The course also addresses ethical implications in the development and application of dynamic models as well as interactions with decision makers. Cadets will spend several lessons in a computer lab environment. |                                                                                                                                          | 2026-1 2027-1 2028-1<br>2029-1             |

| <p>MX400 is the Superintendent's capstone course. With its emphasis on each officer's duty to provide moral leadership, MX400 challenges cadets to become commissioned leaders of character who demonstrate virtue, honor, patriotism, and subordination to civilian authority. In MX400, cadets look both to the past and the future, reflecting on their own character-development experiences as part of the West Point Leader Development System (WPLDS), while also studying the enduring and emerging ethical challenges of the profession they are about to enter. MX400 empowers cadets to understand and embrace their ongoing development as leaders of character and their emerging identities as Army officers. Upon completion of MX400, each cadet should internalize their professional identity and feel confident in his or her ability to apply critical thinking in complex situations and present interdisciplinary solutions to complex military problems. MX400 supports the West Point Writing Program, as one of the two Writing-in-the-Profession courses, with the Pershing Reflective Essay.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

# **PART IV: MAJORS AND MINORS**

## 2029 MAJOR Offerings

Majors available to the Class of 2029 are listed below along with the department that has primary responsibility for them.

By Department:

| Dept         | Code                 | Description                                          | Transcript Description                         |
|--------------|----------------------|------------------------------------------------------|------------------------------------------------|
| MACC-DPE-KIN | <a href="#">KIN1</a> | Kinesiology Major                                    | Kinesiology                                    |
| MADN-BSL     | <a href="#">BEA0</a> | Behavioral Sciences: Applied Psychology Major        | Behavioral Sciences: Applied Psychology        |
| MADN-BSL     | <a href="#">BEM0</a> | Behavioral Sciences: Military & Society Major        | Behavioral Sciences: Military & Society        |
| MADN-BSL     | <a href="#">BEO0</a> | Behavioral Sciences: Organizational Psychology Major | Behavioral Sciences: Organizational Psychology |
| MADN-BSL     | <a href="#">EPS1</a> | Engineering Psychology Major                         | Engineering Psychology                         |
| MADN-BSL     | <a href="#">MGN0</a> | Management Major                                     | Management                                     |
| MADN-CBE     | <a href="#">BIO0</a> | Biology Major                                        | Biology                                        |
| MADN-CBE     | <a href="#">CEN2</a> | Chemical Engineering Major                           | Chemical Engineering                           |
| MADN-CBE     | <a href="#">CES2</a> | Chemical Engineering Studies Major                   | Chemical Engineering Studies                   |
| MADN-CBE     | <a href="#">CHM2</a> | Chemistry Major                                      | Chemistry                                      |
| MADN-CEE     | <a href="#">CVN3</a> | Civil Engineering Major                              | Civil Engineering                              |
| MADN-CEE     | <a href="#">CNG2</a> | Civil Engineering Studies                            | Civil Engineering Studies                      |
| MADN-CEE     | <a href="#">EVE2</a> | Environmental Engineering Major                      | Environmental Engineering                      |
| MADN-CEE     | <a href="#">EES2</a> | Environmental Engineering Studies Major              | Environmental Engineering Studies              |
| MADN-DLP     | <a href="#">LLS3</a> | Law and Legal Studies Major                          | Law and Legal Studies                          |
| MADN-DLP     | <a href="#">PYL2</a> | Philosophy Major                                     | Philosophy                                     |
| MADN-DSE     | <a href="#">ENM1</a> | Engineering Management Major                         | Engineering Management                         |
| MADN-DSE     | <a href="#">SDS1</a> | Systems and Decision Sciences Major                  | Systems and Decision Sciences                  |

## 2029 MAJORS By Discipline

### Humanities and Social Sciences (HSS)

Majors available to the Class of 2029 are listed below along with the department that has primary responsibility for them. The majors are listed as a Humanities and Social Sciences (HSS) or Mathematics, Science, and Engineering (MSE) discipline.

HSS By Department:

| Dept     | Description                                          | Transcript Description                         | Code |
|----------|------------------------------------------------------|------------------------------------------------|------|
| MADN-BSL | Behavioral Sciences: Applied Psychology Major        | Behavioral Sciences: Applied Psychology        | BEA0 |
| MADN-BSL | Behavioral Sciences: Military & Society Major        | Behavioral Sciences: Military & Society        | BEM0 |
| MADN-BSL | Behavioral Sciences: Organizational Psychology Major | Behavioral Sciences: Organizational Psychology | BE00 |
| MADN-BSL | Engineering Psychology Major                         | Engineering Psychology                         | EPS1 |

| Select three complementary support courses in consultation with your DAC, who will provide you with suggested topic areas to consider. Language courses are listed as "LX" and "LA" but cadets can choose any advanced language course for which they qualify. You should limit complementary support courses from within the Department of Behavioral Sciences and Leadership, so as to ensure you meet the academic intent of complementary support. |                                |

**AND****Integrative Experience for the Major**

Choose 1 of 1

PL488B

CAPSTONE SEM IN BEHAVIORAL SCI

**AND****Science Depth**

Although CH275 will be recommended, cadets can select among the following science depth courses.

|       |                      |
|-------|----------------------|
| CH102 | GENERAL CHEMISTRY II |
| CH275 | BIOLOGY              |
| CH375 | ADVANCED BIOLOGY     |
| PH202 | PHYSICS II           |
| PH252 | ADVANCED PHYSICS II  |
| PH275 | PHYSICS II: SPACE    |

**STEM Depth**

Cadets in this major must take CY305/355 to satisfy the STEM Depth requirement.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirements**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Core Engineering Sequence**

Cadets in this major can choose any approved three-course Core Engineering Sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| Select three complementary support courses in consultation with your DAC, who will provide you with suggested topic areas to consider. Language courses are listed as "LX" and "LA" but cadets can choose any advanced language course for which they qualify. You should limit complementary support courses from within the Department of Behavioral Sciences and Leadership, so as to ensure you meet the academic intent of complementary support. |                                |

PL488B

CAPSTONE SEM IN BEHAVIORAL SCI

**AND**

**Science Depth**

Although CH275 will be recommended, cadets can select among the following science depth courses.

|       |                      |
|-------|----------------------|
| CH102 | GENERAL CHEMISTRY II |
| CH275 | BIOLOGY              |
| CH375 | ADVANCED BIOLOGY     |
| PH202 | PHYSICS II           |
| PH252 | ADVANCED PHYSICS II  |
| PH275 | PHYSICS II: SPACE    |

**STEM Depth**

Cadets in this major must take CY305/355 to satisfy the STEM Depth requirement.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirements**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Core Engineering Sequence**

Cadets in this major can choose any approved three-course Core Engineering Sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| PL393                                                   | CRIMINOLOGY-CRIM JUST SYSTM    |
| PL470                                                   | TOPICS-BEHAVIOR SCI/LDRSHIP    |
| PL471                                                   | LEADERSHIP IN COMBAT           |
| <b>AND</b>                                              |                                |
| <b>Complementary Support Courses</b>                    |                                |

Select three complementary support courses in consultation with your DAC, who will provide you with suggested topic areas to consider. Language courses are listed as "LX" and "LA" but cadets can choose any advanced language course for which they qualify. You should limit complementary support courses from within the Department of Behavioral Sciences and Leadership, so as to ensure you meet the academic intent of complementary support.

**Behavioral Sciences CSCs**

Choose 3 of 76

Cadets cannot double count CH375 or PH202/PH275 to satisfy both the CSC requirement and the Science Depth requirement.

Choose 1 of 1

PL488B

CAPSTONE SEM IN BEHAVIORAL SCI

**AND****Science Depth**

Although CH275 will be recommended, cadets can select among the following science depth courses.

|       |                      |
|-------|----------------------|
| CH102 | GENERAL CHEMISTRY II |
| CH275 | BIOLOGY              |
| CH375 | ADVANCED BIOLOGY     |
| PH202 | PHYSICS II           |
| PH252 | ADVANCED PHYSICS II  |
| PH275 | PHYSICS II: SPACE    |

**STEM Depth**

Cadets in this major must take CY305/355 to satisfy the STEM Depth requirement.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirements**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Core Engineering Sequence**

Cadets in this major can choose any approved three-course Core Engineering Sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

PL462

EXPERIMENTAL APP IN PSYCHOLOGY

## 2029 Behavioral Sciences: Organizational Psychology Major Remarks Pending full review of the Curriculum Committee in AY25-2. Elective courses for the major may change.

**AND****Complementary Support Courses**

Choose 3 of 48

For a study in depth choose three complementary support courses within any of the focus areas (DAC will show you a list). For a broadening study, choose any three complementary support courses from across the focus areas. You should limit complementary support courses from within the Department of Behavioral Sciences and Leadership, so as to ensure you meet the academic intent of complementary support. That is to experience the field of engineering psychology from the perspective of professionals outside your field with whom you will work with as part of a multidisciplinary design team. Language courses are listed as "LX" and "LA" but cadets can choose any advanced language course for which they qualify.

| CY355 | CYBER FOUNDATIONS - COMPUTING |

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirements**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Core Engineering Sequence**

Cadets in this major can choose any approved three-course Core Engineering Sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| The CSCs will provide foundational math and science support for cadets in this major.    |                                |
| CH102                                                                                    | GENERAL CHEMISTRY II           |
| MA204                                                                                    | CALCULUS I AND II              |
| MA205                                                                                    | CALCULUS II                    |
| MA255                                                                                    | ADV MULTIVARIABLE CALCULUS     |
| PH202                                                                                    | PHYSICS II                     |
| PH252                                                                                    | ADVANCED PHYSICS II            |
| <b>AND</b>                                                                               |                                |
| <b>Integrative Experience for the Major</b>                                              | Choose 1 of 1                  |
| CH479                                                                                    | METHODS & APPS OF BIOTECH      |
| <b>AND</b>                                                                               |                                |
| <b>Science Depth</b>                                                                     |                                |
| Cadets in this major must take CH375 to satisfy the Science Depth requirement.           |                                |
| CH375                                                                                    | INTRODUCTION TO BIOLOGY        |
| <b>STEM Depth</b>                                                                        |                                |
| Cadets in this major must take CY305/355 to satisfy the STEM Depth requirement.          |                                |
| CY305                                                                                    | CYBER FOUNDATIONS              |
| CY355                                                                                    | CYBER FOUNDATIONS - COMPUTING  |
| <b>AND</b>                                                                               |                                |
| <b>Curriculum Requirements</b>                                                           |                                |
| This section describes how cadets in this major satisfy various curriculum requirements. |                                |
| <b>IT/CYBER Requirement</b>                                                              |                                |

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

CY305

CYBER FOUNDATIONS

CY355

CYBER FOUNDATIONS - COMPUTING

**Core Engineering Sequence**

Cadets in this major may take any approved core engineering sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

**Curriculum Requirements**

This section describes how cadets in this major will satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the core curriculum, EE301 and CH367.

CH367

INTRO / AUTOMATIC PROC CONTROL

EE301

FUNDAMENTALS OF ELEC ENGIN

**Core Engineering Sequence**

Cadets in this major will satisfy the core engineering requirement as part of their major courses.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

CH459

CHEM ENGR LABORATORY

### 2029 Civil Engineering w/ Honors Tracks

| Subject Area | Description |
|--------------|-------------|
|--------------|-------------|

**Coursework Requirements**

Complete 42 total academic courses, which requires one additional course than the requirements for the major as shown above. The additional course can be selected from the Math and Basic Science Electives, the Civil Engineering Electives, or as approved by the Civil Engineering Program Director.

**AND****Requirements for Graduation**

To graduate with Individual Honors a cadet must submit an individual paper or report which can be any of the following:

- (1) A project report for an individual CE489 Advanced Study Project.
- (2) An individual paper written for a regional or national student paper competition.
- (3) An individual paper, suitable for publication or presentation at a professional conference, drawn from one of the following sources:

..... A CE489 Advanced Study Project.

..... A Senior Design Project.

..... An engineering-related Academic Individual Advanced Development (AIAD).

..... An experience relevant to the cadet's program of study and approved by the associated Program Director.

Cadets desiring to aspire to Individual Honors will coordinate with their Department Academic Counselor to develop a plan no later than the end of second class year for completing the individual paper or report. The Department Academic Counselor will certify the completion of the significant individual paper component of the Academic Honors Program.

**AND****Grade Requirements**

Complete the requirements of the major as shown above, and attain an APSC of at least 3.0 in the core curriculum and an APSC of at least 3.5 in the major.

**AND****Examination Requirement**

Pass the Fundamentals of Engineering Examination in the final semester of study.

**AND****Complementary Support Courses**

The following courses provide foundational math, engineering and applied science for cadets in the environmental engineering major.

**Complementary Support Course - Math** Choose 2 of 5

Cadets who take MA104 will take MA205 and MA364. Cadets who validate MA104 (counting towards the Math requirement) will take MA204 or MA255 and MA365 for the Complementary Support Course - Math requirement for this major.

|       |                               |
|-------|-------------------------------|
| MA204 | CALCULUS I AND II             |
| MA205 | CALCULUS II                   |
| MA255 | ADV MULTIVARIABLE CALCULUS    |
| MA364 | ENGINEERING MATHEMATICS       |
| MA365 | ADV MATH FOR ENGRS/SCIENTISTS |

**AND****Complementary Support Courses - Physics** Choose 1 of 3

Cadets must take either PH202, PH252, or PH275.

|       |                     |
|-------|---------------------|
| PH202 | PHYSICS II          |
| PH252 | ADVANCED PHYSICS II |
| PH275 | PHYSICS II: SPACE   |

| CY355 | CYBER FOUNDATIONS - COMPUTING |

**AND**

#### Curriculum Requirements

This section describes how cadets in this major will satisfy various curriculum requirements.

#### IT/CYBER Requirement

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the core curriculum and CY305 or CY355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

#### Core Engineering Sequence

Cadets in this major will satisfy the core engineering requirement as part of their major courses.

#### Writing-in-the-Major

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

|       |                              |
|-------|------------------------------|
| XE401 | INTEGRATIVE SYSTEM DESIGN I  |
| XE402 | INTEGRATIVE SYSTEM DESIGN II |

**AND****Science Depth**

Cadets in this major may take any of the approved options to satisfy the Science Depth requirement.

|       |                      |
|-------|----------------------|
| CH102 | GENERAL CHEMISTRY II |
| CH275 | BIOLOGY              |
| PH202 | PHYSICS II           |
| PH252 | ADVANCED PHYSICS II  |
| PH275 | PHYSICS II: SPACE    |

**STEM Depth**

Cadets in this major will satisfy the STEM Depth requirement by taking CY355.

|       |                               |
|-------|-------------------------------|
| CY355 | CYBER FOUNDATIONS - COMPUTING |
|-------|-------------------------------|

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY355.

|       |                               |
|-------|-------------------------------|
| CY355 | CYBER FOUNDATIONS - COMPUTING |
|-------|-------------------------------|

**Core Engineering Sequence**

Cadets in this major will satisfy the core engineering requirement as part of their major courses.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

|       |                                |

### AND

#### Research Requirement

Consists of both a written document and an oral presentation of a depth and quality suitable for submission to a professional conference.

The research will normally be accomplished as an extension of a project begun in the CS Honors Elective. The research must reflect individual effort, although it may build on an existing group project (especially the context of XE401/402).

Neither the project/research work nor the resulting paper and presentation need be completed during the same semester they are begun, but must be complete by the end of the TEE period of semester 8.

The project/research must be conducted under the supervision/mentorship of a member of the faculty, normally the instructor of the corresponding course. The final written document and oral presentation must be approved by both the research mentor and the Computer Science Program Director.

### AND

#### Grade Requirements

Complete the requirements of the major as shown above, attain an APSC of at least 3.0 in the core curriculum and an APSC of at least 3.5 in the major.

| The research will normally be accomplished as an extension of a research effort or project begun in the honors elective and must reflect individual effort, although it may build on an existing group project. The research must be conducted under the supervision of a member of the faculty and must result in a written paper and oral presentation of a depth and quality suitable for submission to a professional conference. Neither the research nor the resulting paper and presentation need be completed during the semester they are begun, but must be completed by the last day of classes of semester 8. The final written document and oral presentation must be approved by both the research mentor and Cyber Science Program Director. |                                |

|                             | The research will normally be accomplished as an extension of a research effort or project begun in an advanced computing course and must reflect individual effort, although it may build on an existing group project. The research must be conducted under the supervision of a member of the faculty and must result in a written paper and oral presentation of a depth and quality suitable for submission to a professional conference. Neither the research nor the resulting paper and presentation need be completed during the same semester they are begun, but must be completed by the end of the TEE period of semester 8. The final written document and oral presentation must be approved by both the research mentor and the Cyber Science Program Director. |
| <b>AND</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Grade Requirements</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                             | Attain an APSC of at least 3.0 in courses taken for the core curriculum and an APSC of at least 3.5 in courses taken for the major.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 2029 Cyber Security Minor Tracks

| Subject Area                          | Description                                                                                 |
|---------------------------------------|---------------------------------------------------------------------------------------------|
| <b>General Information</b>            |                                                                                             |
|                                       | Cadets majoring in Cyber Science will not be permitted to obtain a minor in Cyber Security. |
| <b>Cyber Foundations Course Track</b> |                                                                                             |

A total of three courses in the overall program of study must be unique to the minor. You must take both courses in the Technical Track. Wherever possible, these courses may be double-counted, such as for cadets pursuing the Cyber Three-Course Engineering Sequence, or EECS, Math, and Systems majors. You must also take at least one course from the Non-Technical Track. Other courses from the Non-Technical Track may be taken as Cyber Application Electives.

**Technical Track**

ETHICS OF TECHNOLOGY

**AND****Cyber Application Electives**

Choose 2 of 36

You must select two courses as electives, focusing on areas where cyber applies to specific domains or learning about thought processes/tools from other disciplines that can be relevant to cyber security. Cyber requires a balance of both technical and non-technical knowledge and skills, as well as application. Cadets may achieve this in any way practical.

### Curriculum Requirements

This section describes how cadets in this major will satisfy various curriculum requirements.

#### IT/CYBER Requirement

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the core curriculum, EE380 and several other courses in the EE major.

|       |                                |
|-------|--------------------------------|
| EE360 | FUNDAMENTALS OF DIGITAL LOGIC  |

| EE377 | ELECTRICAL POWER ENGRNG        |
| EE380 | EMBEDDED SYSTEMS DEVELOPMENT   |
| EE381 | SIGNALS AND SYSTEMS            |
| EE383 | ELECTROMAGN FIELDS & WAVES     |
| EE400 | EE PROFESSIONAL CONSIDERATIONS |
| EE462 | ELECTRONIC DESIGN              |
| XE401 | INTEGRATIVE SYSTEM DESIGN I    |
| XE402 | INTEGRATIVE SYSTEM DESIGN II   |

#### Core Engineering Sequence

Cadets in this major will satisfy the core engineering requirement as part of their major courses.

#### Writing-in-the-Major

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

**AND**

Participate in either an undergraduate research experience or report on their engineering design experience.

Research-focused programs will typically include enrollment in the Advanced Individual Study in Electrical Engineering, EE489, EE489A, EE490, or XE492 the grade for which will be based on a research paper suitable for submission to a conference.

The engineering design experience can result from participation in the Integrative System Design I and II series. The requirement for the engineering paper will be in addition to the XE401-XE402 coursework.

**AND****Grade Requirements**

Cadets must complete the requirements of the major as shown above, attain an APSC of at least 3.0 in the core curriculum and an APSC of at least 3.5 in the major.

**AND****Complementary Support Courses**

Choose 3 of 28

Choose 3 CSCs, each from a different discipline. DACs will counsel cadets on appropriate CSC choices based on language track and courses only counting towards one requirement (track versus CSC). If GE491 or SS486 is selected as a CSC, cadets must choose a different course from the Integrated Experience list (i.e. GE491 or SS486 cannot double-count as a CSC and the IE for the major).

|       |                                |
|-------|--------------------------------|
| EN300 | LITERARY METHODOLOGIES         |
| EN311 | ANCIENT TO EARLY MODERN LIT    |
| EN340 | CONTEMPORARY LITERATURE        |
| EN351 | WORLD LITERATURE               |

| WS358 | STRATEGY AND GENERALSHIP     |
| WS385 | WAR AND ITS THEORISTS        |
| WS455 | COMPARATIVE DEFENSE POLICY   |
| XH405 | THE HOLOCAUST AND ITS LEGACY |

**AND****Integrative Experience for the Major** Choose 1 of 6

Cadets selecting an LN490 course must align this course with the appropriate language track chosen for the major.

|        |                                |
|--------|--------------------------------|
| GE491  | MILITARY GEOGRAPHY             |
| LN490F | FRENCH LANGUAGE & CULTURE CAP  |
| LN490G | GERMAN LANGUAGE & CULTURE CAP  |
| LN490P | PORTUGUESE LANG & CULTURE CAP  |
| LN490S | SPANISH LANGUAGE & CULTURE CAP |
| SS486  | STATE BUILDING                 |

**AND****Science Depth**

Cadets in this major may choose any of the authorized courses to satisfy the Science Depth requirement.

|       |                      |
|-------|----------------------|
| CH102 | GENERAL CHEMISTRY II |
| CH275 | BIOLOGY              |
| PH202 | PHYSICS II           |
| PH252 | ADVANCED PHYSICS II  |
| PH275 | PHYSICS II: SPACE    |

**STEM Depth**

Cadets in this major must take CY305/355 to satisfy the STEM Depth requirement.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Core Engineering Sequence**

Cadets in this major may choose any approved three course engineering sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

|        |                                |
|--------|--------------------------------|
| LN490F | FRENCH LANGUAGE & CULTURE CAP  |
| LN490G | GERMAN LANGUAGE & CULTURE CAP  |
| LN490P | PORTUGUESE LANG & CULTURE CAP  |
| LN490S | SPANISH LANGUAGE & CULTURE CAP |

**STEM Depth**

Cadets in this major must take CY305/355 to satisfy the STEM Depth requirement.

CY305

CYBER FOUNDATIONS

CY355

CYBER FOUNDATIONS - COMPUTING

**AND****Curriculum Requirement**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

CY305

CYBER FOUNDATIONS

CY355

CYBER FOUNDATIONS - COMPUTING

**Core Engineering Sequence**

Cadets in this major may choose any approved three course engineering sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| CY355 | CYBER FOUNDATIONS - COMPUTING |

**AND****Curriculum Requirement**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Core Engineering Sequence**

Cadets in this major may choose any approved three course engineering sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| PH275 | PHYSICS II: SPACE    |

**STEM Depth**

Cadets in this major must take CY305/355 to satisfy the STEM Depth requirement.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**AND****Curriculum Requirement**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Core Engineering Sequence**

Cadets in this major may choose any approved three course engineering sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

### 2029 Regional Studies Minor - Africa Tracks

| Subject Area | Description |
|--------------|-------------|
|--------------|-------------|

The course of instruction for the Regional Studies Minor will consist of five courses that form a coherent, interdisciplinary study of a geographical region. Three of the courses must be in a foreign language at the 300 or 400 level. The other two courses must be regional or comparative course electives. For any Single or Dual Foreign Language majors choosing this minor, exceptions can be made to the language requirement if all possible language courses for the Cadets' chosen region have been completed as part of the major. Cadets who choose the Foreign Area Studies: Africa (FSI1) major are not allowed to choose this minor.

### Language Courses

Take three courses at the 300-level (or higher) in one of the following languages. Any courses taken to fulfill the requirements for this minor are eligible for double-counting practices, including any that are taken to fulfill core, major or minor curricular components. Three courses must be unique to this minor.

**2029 Regional Studies Minor - East Asia Tracks**

| Subject Area | Description |
|--------------|-------------|
|--------------|-------------|

The course of instruction for the Regional Studies Minor will consist of five courses that form a coherent, interdisciplinary study of a geographical region. Three of the courses must be in a foreign language at the 300 or 400 level. The other two courses must be regional or comparative electives. For any Single or Dual Foreign Language majors choosing this minor, exceptions can be made to the language requirement if all possible language courses for the Cadets' chosen region have been completed as part of the major. Cadets who choose the Foreign Area Studies: East Asia (FSA1) major are not allowed to choose this minor.

**Language Courses**

Take three courses at the 300-level (or higher) in the following language. Any courses taken to fulfill the requirements for this minor are eligible for double-counting practices, including any that are taken to fulfill core, major or minor curricular components. Three courses must be unique to this minor.

Choose one course from the following regional track and one course from the regional and comparative studies course track. Any course taken from the Regional Track cannot double-count with the course chosen for the Regional and Comparative Studies Track. All pre-requisites for any courses on these lists should be taken prior to taking the chosen course from either track. Note: Cadets who choose any language other than German to fulfill their language requirement may not choose HI343 from this list.

### 2029 Regional Studies Minor - Middle East Tracks

| Subject Area | Description |
|--------------|-------------|
|--------------|-------------|

The course of instruction for the Regional Studies Minor will consist of five courses that form a coherent, interdisciplinary study of a geographical region. Three of the courses must be in a foreign language at the 300 or 400 level. The other two courses must be regional or comparative electives. For any Single or Dual Foreign Language majors choosing this minor, exceptions can be made to the language requirement if all possible language courses for the Cadets' chosen region have been completed as part of the major. Cadets who choose the Foreign Area Studies: Middle East (FSM1) major are not allowed to choose this minor.

#### Language Courses

Take three courses at the 300-level (or higher) in one of the following languages. Any courses taken to fulfill the requirements for this minor are eligible for double-counting practices, including any that are taken to fulfill core, major or minor curricular components. Three courses must be unique to this minor.

**AND**

**Integrative Experience for the Major** Choose 1 of 1

GE494 ENVIRONMENTAL SECURITY

**AND****Science Depth**

Cadets in this major must take CH102 to satisfy the Science Depth requirement.

CH102 GENERAL CHEMISTRY II

**STEM Depth**

Cadets in this major must take CY305/355 to satisfy the STEM Depth requirement.

CY305 CYBER FOUNDATIONS

CY355 CYBER FOUNDATIONS - COMPUTING

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

CY305 CYBER FOUNDATIONS

CY355 CYBER FOUNDATIONS - COMPUTING

**Core Engineering Sequence**

Cadets in this major are directed to take the Environmental Engineering sequence to support their major.

EV300 ENVIRONMENTAL SCIENCE

EV350 ENVIRONMNTL ENGR TECHNOLOGIES

EV450 ENV ENG FOR COMMUNITY DEVELOP

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

GE300 GLOBAL ENVIRONMENTAL SYSTEMS

| PH275 | PHYSICS II: SPACE        |

**STEM Depth**

Cadets in this major must take CY305/355 to satisfy the STEM Depth requirement.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Core Engineering Sequence**

Cadets in this major are required to take the Environmental Engineering Sequence.

|       |                               |
|-------|-------------------------------|
| EV300 | ENVIRONMENTAL SCIENCE         |
| EV350 | ENVIRONMNTL ENGR TECHNOLOGIES |
| EV450 | ENV ENG FOR COMMUNITY DEVELOP |

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

|       |                             |

PHYSICS II: SPACE

**STEM Depth**

Cadets in this major must take CY305/355 to satisfy the STEM Depth requirement.

CY305

CYBER FOUNDATIONS

CY355

CYBER FOUNDATIONS - COMPUTING

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

CY305

CYBER FOUNDATIONS

CY355

CYBER FOUNDATIONS - COMPUTING

**Core Engineering Sequence**

Cadets in this major may choose any authorized engineering sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

**AND****Complementary Support Courses**

Cadets in this major will fulfill the Complementary Support Course requirement by taking a third semester in a foreign language and two additional choices.

**AND****Complementary Support Course - Foreign Language**

Choose 1 of 1

LX300

3RD SEMESTER FOREIGN LANG

**AND****Complementary Support Courses - Electives**

Choose 2 of 72

Depending on their particular research interests, cadets will consult with their academic counselor to choose their final two CSCs. The courses found on the following list of courses could all aid in an historian's research abilities and methodologies, but a cadet may deviate from this list as long as they can justify why using a course not found on it will aid them in their historical study. In addition, a cadet may choose to fulfill this requirement by taking two additional courses in their chosen foreign language. This includes the DFL courses on regional civilization (example: LA483 Arab Civilization I), and regional literature (example: LF485 Survey of French Literature I).

**AND****Integrative Experience for the Major**

Choose 1 of 1

Cadets majoring in History must complete an integrative experience during their second- or first-class year. Cadets will work with their DACs to identify in which course they intend to complete their integrative experience requirement. Once DACs verify with course directors that cadets have completed integrative experience requirements as planned, they will take administrative action to count that elective for integrative experience credit.

**AND****Complementary Support Courses**

Cadets in this major will fulfill the Complementary Support Course requirement by taking a third semester in a foreign language and two additional choices.

**AND****Complementary Support Course - Foreign Language**

Choose 1 of 1

LX300

3RD SEMESTER FOREIGN LANG

**AND****Complementary Support Courses - Electives**

Choose 2 of 72

Depending on their particular research interests, cadets will consult with their academic counselor to choose their final two CSCs. The courses found on the following list of courses could all aid in an historian's research abilities and methodologies, but a cadet may deviate from this list as long as they can justify why using a course not found on it will aid them in their historical study. In addition, a cadet may choose to fulfill this requirement by taking two additional courses in their chosen foreign language. This includes the DFL courses on regional civilization (example: LA483 Arab Civilization I), and regional literature (example: LF485 Survey of French Literature I).

**AND****Integrative Experience for the Major**

Choose 1 of 1

Cadets majoring in History must complete an integrative experience during their second- or first-class year. Cadets will work with their DACs to identify in which course they intend to complete their integrative experience requirement. Once DACs verify with course directors that cadets have completed integrative experience requirements as planned, they will take administrative action to count that elective for integrative experience credit.

**AND****Complementary Support Courses**

Cadets in this major will fulfill the Complementary Support Course requirement by taking a third semester in a foreign language and two additional choices.

**AND****Complementary Support Course - Foreign Language**

Choose 1 of 1

LX300

3RD SEMESTER FOREIGN LANG

**AND****Complementary Support Courses - Electives**

Choose 2 of 72

Depending on their particular research interests, cadets will consult with their academic counselor to choose their final two CSCs. The courses found on the following list of courses could all aid in an historian's research abilities and methodologies, but a cadet may deviate from this list as long as they can justify why using a course not found on it will aid them in their historical study. In addition, a cadet may choose to fulfill this requirement by taking two additional courses in their chosen foreign language. This includes the DFL courses on regional civilization (example: LA483 Arab Civilization I), and regional literature (example: LF485 Survey of French Literature I).

**AND****Integrative Experience for the Major**

Choose 1 of 1

Cadets majoring in History must complete an integrative experience during their second- or first-class year. Cadets will work with their DACs to identify in which course they intend to complete their integrative experience requirement. Once DACs verify with course directors that cadets have completed integrative experience requirements as planned, they will take administrative action to count that elective for integrative experience credit.

| Cadets may also choose from a variety of seminars, colloquia, summer AIADs for credit, and independent studies in any department, when topics are offered that are relevant to the Applied Statistics Minor. Approval authority for inclusion of these courses is the Applied Statistics DAC in the Department of Mathematical Sciences, who will coordinate with the offering department. |                          |

**AND****Complementary Support Courses - Elective Tracks**

Cadets may choose from these following courses to satisfy the remaining two CSC requirements. The list is organized into groups/themes to guide the selection process. DACs, in most cases, will guide cadets to choose two courses within a particular theme. If cadets are taking any of the courses on the following lists as part of their Core Engineering Sequence, these courses cannot be used to fulfill the two CSC requirements for the major.

**Computational Mathematics Tools** Choose 2 of 7

**STEM Depth**

Cadets in this major must take MA204 or MA205 to satisfy the STEM Depth requirement.

|       |                   |
|-------|-------------------|
| MA204 | CALCULUS I AND II |
| MA205 | CALCULUS II       |

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**Core Engineering Sequence**

Cadets in this major may choose any authorized engineering sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| Cadets may choose from these following courses to satisfy the remaining two CSC requirements. The list is organized into groups/themes to guide the selection process. DACs, in most cases, will guide cadets to choose two courses within a particular theme. If cadets are taking any of the courses on the following lists as part of their Core Engineering Sequence, these courses cannot be used to fulfill the two CSC requirements for the major. |                                |

| PH202 | PHYSICS II           |
| PH252 | ADVANCED PHYSICS II  |
| PH275 | PHYSICS II: SPACE    |

#### STEM Depth

Cadets in this major must take MA204 or MA205 to satisfy the STEM Depth requirement.

|       |                   |
|-------|-------------------|
| MA204 | CALCULUS I AND II |
| MA205 | CALCULUS II       |

#### AND

#### Curriculum Requirements

This section describes how cadets in this major satisfy various curriculum requirements.

#### IT/CYBER Requirement

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

#### Core Engineering Sequence

Cadets in this major may choose any authorized engineering sequence.

#### Writing-in-the-Major

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

|       |                     |

#### Curriculum Requirements

This section describes how cadets in this major satisfy various curriculum requirements.

#### IT/CYBER Requirement

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

#### Core Engineering Sequence

Cadets in this major have embedded engineering courses that enable it to satisfy the core engineering sequence requirement.

#### Writing-in-the-Major

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| SE402 | SYSTEMS DESIGN & MANAGEMENT I  |
| SE403 | SYSTEMS DESIGN & MANAGEMENT II |

**OR****Integrative Experience - Research**

Choose 2 of 2

Or choose a 2-course research sequence in another department as approved by the OR Program Director.

|       |                                |
|-------|--------------------------------|
| MA498 | SR THESIS I: RSCRCH & PROPOSAL |
| MA499 | SR THESIS II: PAPER & DEFENSE  |

**AND****Science Depth**

Cadets in this major may choose any one of the following authorized courses to satisfy the Science Depth requirement.

|       |                      |
|-------|----------------------|
| CH102 | GENERAL CHEMISTRY II |
| CH275 | BIOLOGY              |
| PH202 | PHYSICS II           |
| PH252 | ADVANCED PHYSICS II  |
| PH275 | PHYSICS II: SPACE    |

**STEM Depth**

Cadets in this major must take MA204/MA205 or MA255 to satisfy the STEM Depth requirement.

|       |                            |
|-------|----------------------------|
| MA204 | CALCULUS I AND II          |
| MA205 | CALCULUS II                |
| MA255 | ADV MULTIVARIABLE CALCULUS |

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

CY305

CYBER FOUNDATIONS

CY355

CYBER FOUNDATIONS - COMPUTING

**Core Engineering Sequence**

Cadets in this major have embedded engineering courses that enable it to satisfy the core engineering sequence requirement.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

MA376

APPLIED STATISTICS

## 2029 Operations Research Studies Major Remarks Alternate major for Operations Research since Class of 2019.

### 2029 Operations Research with Honors Curriculum

PH252

ADVANCED PHYSICS II

PH275

PHYSICS II: SPACE

**STEM Depth**

Cadets in this major must take MA204 or MA205/255 to satisfy the STEM Depth requirement.

MA204

CALCULUS I AND II

MA205

CALCULUS II

MA255

ADV MULTIVARIABLE CALCULUS

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing EE301 and ME202.

EE301

FUNDAMENTALS OF ELEC ENGIN

ME202

INTRO COMPUTATIONAL ANALYSIS

**Core Engineering Sequence**

Cadets in this major will satisfy the core engineering requirement as part of their major courses.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

**AND****Complementary Support Courses** Choose 3 of 4

The following courses provide foundational math and applied science for cadets in the mechanical engineering major. For the math requirement, a cadet should take MA364 but may substitute MA365 if qualified.

|       |                               |
|-------|-------------------------------|
| EE301 | FUNDAMENTALS OF ELEC ENGIN    |
| MA364 | ENGINEERING MATHEMATICS       |
| MA365 | ADV MATH FOR ENGRS/SCIENTISTS |
| MC300 | FUND OF ENGR MECH AND DESIGN  |

**AND****Integrative Experience - First Course** Choose 1 of 2

|       |                               |
|-------|-------------------------------|
| ME404 | MECHANICAL ENGINEERING DESIGN |
| XE485 | ENGINEERING CAPSTONE DESIGN I |

**AND****Integrative Experience - Second Course** Choose 1 of 2

|       |                                |
|-------|--------------------------------|
| ME496 | MECHANICAL SYSTEM DESIGN       |
| XE495 | ENGINEERING CAPSTONE DESIGN II |

**AND****Science Depth**

Cadets in this major must take PH202, PH252, or PH275 to satisfy the Science Depth requirement.

|       |                     |
|-------|---------------------|
| PH202 | PHYSICS II          |
| PH252 | ADVANCED PHYSICS II |
| PH275 | PHYSICS II: SPACE   |

**STEM Depth**

Cadets in this major must take MA204/MA205 or MA255 to satisfy the STEM Depth requirement.

|       |                            |
|-------|----------------------------|
| MA204 | CALCULUS I AND II          |
| MA205 | CALCULUS II                |
| MA255 | ADV MULTIVARIABLE CALCULUS |

**AND****Curriculum Requirements**

This section describes how cadets in this major will satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the core curriculum, EE301 and ME202.

|       |                            |
|-------|----------------------------|
| EE301 | FUNDAMENTALS OF ELEC ENGIN |
| ME202 | COMPUTER AIDED DESIGN      |

**Core Engineering Sequence**

Cadets in this major will satisfy the core engineering requirement as part of their major courses.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and ME400.

|       |                                |
|-------|--------------------------------|
| ME400 | MECHANICAL ENGINEERING SEMINAR |
|-------|--------------------------------|

| The following courses provide foundational math and applied science for cadets in the mechanical engineering major. For the math requirement, a cadet should take MA364 but may substitute MA365 if qualified. For the IT/CYBER requirement, a cadet may take EE301 or CY305 or CY355. |                                |

| PH275                                                                                                                                                                                                                                                                                  | PHYSICS II: SPACE              |

**STEM Depth**

Cadets in this major must take MA204/MA205 or MA255 to satisfy the STEM Depth requirement.

|       |                            |
|-------|----------------------------|
| MA204 | CALCULUS I AND II          |
| MA205 | CALCULUS II                |
| MA255 | ADV MULTIVARIABLE CALCULUS |

**AND****Curriculum Requirements**

This section describes how cadets in this major will satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the core curriculum, EE301 (or CY305/355) and ME202.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |
| EE301 | FUNDAMENTALS OF ELEC ENGIN    |
| ME202 | COMPUTER AIDED DESIGN         |

**Core Engineering Sequence**

Cadets in this major will satisfy the core engineering requirement as part of their major courses.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and ME400.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum, EE301 and NE361.

EE301

FUNDAMENTALS OF ELEC ENGIN

NE361

COMPUTATIONAL DESIGN IN NE

**Core Engineering Sequence**

Cadets in this major will satisfy the core engineering requirement as part of their major courses.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| Cadets must demonstrate excellence by writing a paper based upon the results of the NE389 or NE489, an AIAD, or their integrative experience that is suitable for submission to an undergraduate level journal. Present this paper at, for example, USMA Project's Day, a PaNE colloquium, or an ANS Student Conference. The Head of the Department of Physics and Nuclear Engineering will determine whether the quality of the work completed is sufficient to merit successful completion of the honors program. |                             |

### 2029 Nuclear Science Minor Tracks

#### Subject Area

#### Description

Cadets enrolled in the minor must take four courses: NE300, NE355, NE452, and either NE361 or NE474 (no course substitution authorized). Two courses may be substituted for NE350, NE450, and either NE361 or NE474 at the discretion of the Head of the Department of Physics and Nuclear Engineering. Course substitutes must include significant content of basic science (physical, biological, and chemical), mathematics, or engineering science and engineering topics.

Choose 3 of 3

(no substitution)

|       |                               |
|-------|-------------------------------|
| NE300 | FUNDAMENTALS OF NUCLEAR ENGR  |
| NE355 | NUCLEAR REACTOR ENGINEERING   |
| NE452 | INSTRUMENTATION AND SHIELDING |

**AND**

Choose 1 of 2

(no substitution)

|       |                            |
|-------|----------------------------|
| NE361 | COMPUTATIONAL DESIGN IN NE |
| NE474 | RADIOLOGICAL SAFETY        |

**AND**

Choose 2 of 3

For Cadets who chose NE474 above: (course substitution at the discretion of the Head, D/PaNE)

|       |                            |
|-------|----------------------------|
| NE350 | RADIOLOGICAL ENGR DESIGN   |
| NE361 | COMPUTATIONAL DESIGN IN NE |
| NE450 | NUCLEAR WEAPONS EFFECTS    |

**OR**

Choose 2 of 3

For Cadets who chose NE361 rather than NE474: (course substitution at the discretion of the Head, D/PaNE)

|       |                          |
|-------|--------------------------|
| NE350 | RADIOLOGICAL ENGR DESIGN |
| NE450 | NUCLEAR WEAPONS EFFECTS  |
| NE474 | RADIOLOGICAL SAFETY      |

| This section describes how cadets in this major satisfy various curriculum requirements.                                                                                     |                               |
| <b>IT/CYBER Requirement</b>                                                                                                                                                  |                               |
| Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum, EE301 and PH456.                          |                               |
| EE301                                                                                                                                                                        | FUNDAMENTALS OF ELEC ENGIN    |
| PH456                                                                                                                                                                        | SCIENCE AND POLICY            |
| <b>Core Engineering Sequence</b>                                                                                                                                             |                               |
| Cadets in this major can choose any approved three-course Core Engineering Sequence.                                                                                         |                               |
| <b>Writing-in-the-Major</b>                                                                                                                                                  |                               |
| Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major. |                               |
| PH456                                                                                                                                                                        | SCIENCE AND POLICY            |

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum, EE301 and PH456.

|       |                            |
|-------|----------------------------|
| EE301 | FUNDAMENTALS OF ELEC ENGIN |
| PH456 | SCIENCE AND POLICY         |

**Core Engineering Sequence**

Cadets in this major may choose any approved three-course Core Engineering Sequence.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| <b>Honors Program</b>                                                                                                                                                                                                                                                                                                                   |                                |
| The honors program in space science entails the completion of two courses beyond the 13-course major. An essential component of this program is cadet participation in space science, physics, or nuclear engineering research. The Required Space Science Related Elective cannot double count towards fulfilling Honors requirements. |                                |
| <b>Required Courses</b>                                                                                                                                                                                                                                                                                                                 | Choose 1 of 6                  |

| Choose one of the following Space and Missile Defense (SMD) critical areas of interest; Space Science, Missile Defense, Directed Energy, Cyber Operations, and Policy Development from which to select your two electives for this minor. These related discipline electives are further grouped by root electives that support areas of interest that are inherent in particular majors. These groupings allow the student to synthesize and ponder how to apply these respective electives to SMD critical areas of interest as well as space exploration. Cadets choosing this minor must meet all prerequisites for the courses chosen. Cadets majoring in Space Science are not eligible for this minor. |                                |

**AND****Complementary Support Courses**

Choose 3 of 68

Complementary Support Courses provide cadets exposure to concepts relevant to the study of American Politics from a different disciplinary perspective. For a study-in-depth, choose three complementary support courses from within any of the focus areas (see the Department Academic Counselor for a list of the current focus areas). For a broadening study, choose any three complementary support courses from this list.

| The American Politics with Thesis (Honors) Program is open to cadets who demonstrate exceptional academic aptitude in the American politics major. Cadets aspiring to graduate with an American Politics major with Honors must complete all requirements of the American Politics with Thesis track and satisfy additional course and grade requirements. Honors cadets must complete all the course requirements for the American Politics major, complete a thesis by taking SS489A and SS498A their Firstie year, and take one additional American Politics Elective to increase the depth of study in their major. The additional elective will normally be taken in the cadet's Cow year.                              |                                |

| Honors students will continue work on their theses in SS498A Senior Thesis in American Politics, taken in the spring of the first class year when they will finish writing and defend their theses. SS498A Senior Thesis in American Politics consists of independent study and weekly meetings between individual cadets and their thesis advisors. Cadets will be responsible for coordinating meetings with their advisor. Course requirements will include a 30-50 page thesis submitted NLT lesson 35, and a defense of the thesis before their entire committee during the final two weeks of classes. Upon completion of the thesis and defense, the thesis committee recommends a final grade to the thesis advisor. |                                |

| Subject Area                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Description                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| <b>Program Requirements</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                |
| The American Politics major with Thesis track will consist of a two-course sequence in addition to the requirements of the major, culminating in the cadet writing a thesis and defending it in front of a thesis committee.                                                                                                                                                                                                                                                              |                                |
| Cadets aspiring to graduate with a thesis will take SS489A in the fall and SS498A in the spring of their Firstie year as part of a two-course thesis sequence. Throughout the year, cadets will prepare and write an in-depth research paper that brings together theoretical perspectives acquired during their earlier studies. In SS489A, Thesis students will complete the literature review, an annotated bibliography, and a prospectus for their theses.                           |                                |
| Choose 1 of 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                |
| SS498A: Senior Thesis in American Politics consists of independent study and weekly meetings between individual cadets and their thesis advisors. Cadets will be responsible for coordinating meetings with their advisor. Course requirements will include an approximately 30-50 page thesis and a defense of the thesis before their entire committee on Projects Day. Upon completion of the thesis and defense, the thesis committee recommends a final grade to the thesis advisor. |                                |
| SS498A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | SENIOR THESIS IN AMER POLITICS |

|                          | The Economics Honors Program will consist of a two-course sequence culminating in the cadet writing a thesis and defending it in front of a thesis committee. The first course will be an additional 300- or 400-level economics elective or Complementary Support Course relevant to the cadet's desired thesis topic. The second course will be an existing three-credit course, SS498C Senior Thesis in Economics, taken in the spring of the first class year when the honors cadets will finish writing and defend their theses. |

| <b>Program Requirements</b> | The International Affairs with Honors designation is available to cadets majoring in International Affairs Foreign Policy and Security Studies (PIF0) and International Affairs - Institutions, Governance, and Development (PII0). Awarding of the Honors designation requires the successful completion of a research project in one of three capstone courses, two additional IA courses beyond the 10 course base major (not including the required three CSC courses), and the achievement of a specified grade requirement in both the core curriculum and the IA major. SS489B and SS498B can fulfill the two additional IA course requirement for thesis cadets. |
| <b>AND</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Awarding of the Honors designation requires the successful completion of a research project in one of three capstone courses, two additional IA courses beyond the 10 course base major (not including the required three CSC courses), and the achievement of a specified grade requirement in both the core curriculum and the IA major. SS489B and SS498B can fulfill the two additional IA course requirement for thesis cadets. |
| <b>AND</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Grade Requirements</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Complete the requirements of the major as shown above, attain an APSC of at least 3.0 in the core curriculum and an APSC of at least 3.5 in the major.

| All majors will choose three classes from beyond the discipline of political science as their complementary support courses. Cadets can request courses not in these groupings based on approval of the DAC or Program Director.                                                                                                                                                                  |                                |
| Cadets should be aware that some of these courses have prerequisites that may be difficult to attain, some courses are only offered at certain times, and course prerequisites may change. If cadets do not meet the prerequisite requirements but still would like to take the course, they are responsible to meet with the course director to see if taking the course will still be feasible. |                                |

**AND****Complementary Support Courses**

All majors will choose three classes from beyond the discipline of political science as their complementary support courses. Cadets can request courses not in these groupings based on approval of the DAC or Program Director.

Cadets should be aware that some of these courses have prerequisites that may be difficult to attain, some courses are only offered at certain times, and course prerequisites may change. If cadets do not meet the prerequisite requirements but still would like to take the course, they are responsible to meet with the course director to see if taking the course will still be feasible.

**CSC-Foreign Language**

Choose 3 of 24

Take three upper division courses in the same language (typically LX371, LX372, and LX475)

| PH202 | PHYSICS II           |
| PH252 | ADVANCED PHYSICS II  |
| PH275 | PHYSICS II: SPACE    |

**STEM Depth**

Cadets in this major must take CY305/CY355 to satisfy the STEM Depth Requirement.

|       |                               |
|-------|-------------------------------|
| CY305 | CYBER FOUNDATIONS             |
| CY355 | CYBER FOUNDATIONS - COMPUTING |

**AND**

**Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirement**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

CY305

CYBER FOUNDATIONS

CY355

CYBER FOUNDATIONS - COMPUTING

**Core Engineering Sequence**

Cadets in this major may select any Core Engineering Sequence. This sequence is selected in the fall semester of their third class year.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| This section describes how cadets in this major satisfy various curriculum requirements.    |                                |

**IT/CYBER Requirements**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and CY305/355.

CY305

CYBER FOUNDATIONS

CY355

CYBER FOUNDATIONS - COMPUTING

**Core Engineering Sequence**

Cadets in this major will satisfy the core engineering requirement as part of their major courses.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| A minimum of 42 total academic courses (3.0 credit hours or higher, taken or validated) are required to achieve the Honors distinction. All Honors Cadets will take SE491 in addition to one extra elective. This 42nd course defaults to SE490 but can be substituted for a different elective track course or other approved by the Program Director. |                                |

| <b>Overarching Requirements</b>                                                                                                                                                                                                                                                                                                                         |                                |
| A minimum of 42 total academic courses (3.0 credit hours or higher, taken or validated) are required to achieve the Honors distinction. All Honors Cadets will take SE491 in addition to one extra elective. This 42nd course defaults to SE490 but can be substituted for a different elective track course or other approved by the Program Director. |                                |
| <b>Research Course</b>                                                                                                                                                                                                                                                                                                                                  | Choose 2 of 2                  |

| <b>Complementary Support Courses - Elective Tracks</b> |                                |

Choose one of the following elective tracks: Aerospace Systems, Artificial Intelligence, Cyber Security Systems, General Engineering, Geographic Information Systems, Human Systems Integration, Nuclear Systems, Robotic Systems, Software Systems, Sustainable Systems, and Cadet Engineered Systems Design. The elective tracks consist of EE301, MC300, and three courses that provide depth in a chosen engineering domain discipline outside the major.

MA205

CALCULUS II

MA255

ADV MULTIVARIABLE CALCULUS

**AND****Curriculum Requirements**

This section describes how cadets in this major satisfy various curriculum requirements.

**IT/CYBER Requirements**

Cadets in this major will satisfy the IT/CYBER requirement by successfully completing the IT/CYBER content in the core curriculum and the combination of EE301, SE370 and SE400.

EE301

FUNDAMENTALS OF ELEC ENGIN

SE370

COMPUTER AIDED SYSTEMS ENG

SE400

PROFESSIONAL ENGINEERING  
SEMIN

**Core Engineering Sequence**

Cadets in this major will satisfy the core engineering requirement as part of their major courses.

**Writing-in-the-Major**

Cadets in this major satisfy the West Point Writing Program requirement by successfully completing writing requirements in the core curriculum and this course in the major.

| A minimum of 42 total academic courses (3.0 credit hours or higher, taken or validated) are required to achieve the Honors distinction. All Honors Cadets will take SE491 in addition to one extra elective. This 42nd course defaults to SE490 but can be substituted for a different elective track course or other approved by the Program Director. |                                |
| <b>Research Course</b>                                                                                                                                                                                                                                                                                                                                  | Choose 2 of 2                  |

| <b>Grade Requirement</b>                                                                                                                                                                                                                                                                                                                                |                                |
| Complete the requirements of the major as shown above, attain an APSC of at least 3.0 in the core curriculum, and at least a 3.5 in the major.                                                                                                                                                                                                          |                                |

# APPENDIX

**Substantive and Select Administrative Changes**  
(since the AB last approved the Redbook, 27 June 2024)

**Department of Behavioral Sciences and Leadership:**

New major, Behavioral Sciences (3 tracks), effective for the Class of 2026

Sunset the Psychology Major (2 tracks), with GY2025 as the last official class year

Sunset the Sociology Major, with GY2025 as the last official class year

Archive PL371 Introduction to Sociology (3.0CR), PL377 Social Inequality (3.0CR), PL384 Sociological Theory (3.0CR), and PL488D Colloquium-BSL-Sociology (3.0CR)

**Department of Chemistry and Life Science:**

New minor, Bioengineering, effective for the Class of 2026

Change the name of the major from “Life Science” to “Biology,” effective for the GY2026 and beyond

**Department of Civil and Mechanical Engineering:**

Provisionally approved course, AE201 Introduction to Aerospace Engineering (3.5CR), effective AY26-1

Provisionally approved courses, AE189(A) Ind Study in Aerospace Eng (1.0CR), AE289(A) Ind Study in Aerospace Eng (2.0CR), AE389(A) Ind Study in Aerospace Eng (3.0CR), and AE489(A) Adv Ind Study in Aerospace Eng (3.0CR), effective AY26-1

New course, XE200 Scientific Argument (1.0CR), effective AY26-2

Sunset the Aeronautical Engineering minor, with GY2027 as the last official class year

Course conversion, archive MC306 Dynamics (3.0CR) and replace with ME306 Dynamics (3.0CR), effective AY2026-1

Course conversion, archive MC311 Thermal-Fluid Systems I (3.5CR) and replace with CV311 Thermal-Fluid Systems I (3.5CR), effective AY2027-1

Course conversion, archive MC364 Mechanics of Materials (3.5CR) and replace with CE364 Mechanics of Materials (3.5CR), effective AY2026-2

Course conversion, archive MC380 Engineering Materials (3.5 CR) and replace with ME380 Engineering Materials (3.5CR), effective AY2026-1

Course conversion, archive MC486 Vibration Engineering (3.0CR) and replace with ME486 Vibration Engineering (3.0CR), effective AY2026-2

### **Department of Electrical Engineering and Computer Science:**

Modified major, Cyber Science Major (CYS1) with Cyber Science: Cyber Operations Track (CYO0), effective for the Class of 2028

New core engineering sequence, Artificial Intelligence and Data Engineering (CES-AI), effective for the Class of 2028

New course, EE484 Fundamentals of Robotics (3.0CR), effective AY26-2

Course conversion, archive EE487 Embedded Systems Development (3.0CR) and replace with EE380 Embedded Systems Development, effective AY26-1

### **Department of English and World Languages:**

Sunset the Diversity and Inclusion Studies Minor, with GY2024 as the last official class year

Archive EN352 Power and Difference (3.0CR)

### **Department of Geography and Environmental Engineering:**

Change the name of the major from “Geospatial Information Science” to “Geospatial Science,” effective for the GY2026 and beyond

Sunset the Geography Minor, with GY2024 as the last official class year

New course, GE300 Global Environmental Systems (3.0CR), effective AY26-1

Modified major, Geography (1 track), effective for the Class of 2028

EV to GE course conversions, effective AY26-1, for the following courses:

|        |                              |  |        |                              |
|--------|------------------------------|--|--------|------------------------------|

Sunset the America in the World Minor, with GY2025 as the last official class year

Sunset the War, Technology, and Society Minor, with GY2025 as the last official class year

New core course, HI108W Foundations of the Modern World, effective AY26-1

New course, HI377 Empires & Revolutions (3.0CR), effective AY27-2

New course, HI378 Industry, Ideology & the State (3.0CR), effective AY28-1

New course, HI387 Topics in American History (3.0CR), effective AY26-1

New course, HI388 Topics in International History (3.0CR), effective AY26-1

New course, HI389 Topics in Military History (3.0CR), effective AY26-1

New course, WS301 Introduction to War Studies (3.0CR), effective AY26-1

New course, WS389 War in the Contemporary World (3.0CR), effective AY27-2

Course conversion, archive HI390 Early National America (3.0CR) and replace with HI487 The Early American Republic, 1787-1826 (3.0CR), effective AY27-1

Archive, HI101 The Army of the Republic: Leading Citizen Soldiers (3.0CR), HI108A-U Regional Studies in World History (6 tracks: Africa, East Asia, Latin America, Middle East, Russia, Europe) (3.0CR), HI354 World War I in Global Perspective (3.0CR), HI365 The Ancient World (3.0 CR), HI461 Topics in Gender History (3.0CR), HI463 Race, Ethnicity, Nation (3.0CR), XH341 Intel Cyber History (3.0CR)

### **Department of Law and Philosophy: N/A**

### **Department of Mathematical Sciences:**

New course, MA204 Calculus I and II (4.5CR), effective AY25-2

### **Department of Military Instruction:**

Sunset the Defense and Strategic Studies Major, with GY2027 as the last official class year

New advanced course, MS250 Advanced Fundamentals of Small Unit Operations (1.5CR), effective AY26-1

New advanced course, MS350 Advanced Platoon Operations (1.5CR), effective AY26-1

Archive all DS courses and convert to WS (War Studies) prefix, effective AY28

**Department of Physical Education: N/A**

**Department of Physics and Nuclear Engineering: N/A**

**Department of Social Sciences:**

Change the name of the major from “Political Science: American Politics” to “American Politics,” effective for the GY2025 and beyond

Sunset the Grand Strategy Minor, with GY2025 as the last official class year

Archive SS381 Cultural and Political Anthropology (3.0CR)

**Department of Systems Engineering:**

Sunset the Systems Engineering Minor, with GY2024 as the last official class year

Archive XH102, Introduction to Excel Scholars Program (0.5CR), XH201 Foundations of Excel Program (0.5CR), and XH301 Foundations of Excel Program (0.5CR), effective AY25-2
