| Cadets travel to and reside in a linguistic and cultural community for three weeks. There they use their knowledge of French, its varieties and connected cultures to accomplish learning tasks, solve problems and live daily routines. A structured program of immersion may include visits to sites of military, political, historical, or social significance; official orientations and lectures; meetings with local or national civilian and military leaders; and directed language learning activities. A department instructor accompanies the participating cadets who are obliged to use French during this extended stay.   |                             | 2026-7 2027-7 2028-7<br>2029-7             |

| Cadets achieve communication skills in Hebrew in a real-world context through assigned language-learning tasks, instructor's guidance and immersion in the culture of the target language. Each cadet will develop and improve language proficiency while increasing cross-cultural competence in the Hebrew-speaking world.                                                                                                                                                                                                                                                                                                                        |                                       | No Course Offerings                                |

| Cadets travel to and reside in a linguistic and cultural community for three weeks. There they use their knowledge of Portuguese, its varieties and connected cultures to accomplish learning tasks, solve problems and live daily routines. A structured program of immersion may include visits to sites of military, political, historical, or social significance; official orientations and lectures; meetings with local or national civilian and military leaders; and directed language learning activities. A department instructor accompanies the participating cadets who are obliged to use Portuguese during this extended stay.      |                                       | 2026-7 2027-7 2028-7<br>2029-7                     |

| Cadets travel to and reside in a linguistic and cultural community for three weeks. There they use their knowledge of Russian, its varieties and connected cultures to accomplish learning tasks, solve problems and live daily routines. A structured program of immersion may include visits to sites of military, political, historical, or social significance; official orientations and lectures; meetings with local or national civilian and military leaders; and directed language learning activities. A department instructor usually accompanies participating cadets who complete all work in the language during this extended stay. |                                       | 2026-7 2027-7 2028-7<br>2029-7                     |

| Cadets travel to and reside in a linguistic and cultural community where they use their knowledge of Persian, its varieties and connected cultures to accomplish research tasks, solve problems and live daily routines. A structured program of immersion may include visits to sites of military, political, historical, or social significance; official orientations and lectures; meetings with local or national civilian and military leaders; as well as research in the language. A Department instructor may accompany participating cadets, who complete all work in the language during this extended stay.                             |                                       | 2026-7 2027-7 2028-7<br>2029-7                     |

| Cadets experience an intensive program of study and cultural activities tailored to their skill level at a language institute in a site in a German-speaking country. Classes meet three to four hours per day in small groups of six to eight students. Classes address speaking, listening, reading and writing, and emphasize improvement of speaking and listening proficiency. Students may reside with German host families and conduct local cultural excursions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                          | 2029-7                                             |

| Cadets travel to and reside in a linguistic and cultural community where they use their knowledge of a second language, its varieties and connected cultures to accomplish research tasks, solve problems and live daily routines. A structured program of immersion may include visits to sites of military, political, historical, or social significance; official orientations and lectures; meetings with local or national civilian and military leaders; as well as research in the language. A department instructor accompanies participating cadets who complete all work in the language during this extended stay.                                                                                                                                                                                                                                                                                                                                       |                                          | 2026-7 2027-7 2028-7<br>2029-7                     |

| Cadets travel to and, over an extended period, reside in a linguistic and cultural community where they develop further their foreign language proficiency, cultural competence and regional capability. A structured program of experiential learning includes visits to sites of cultural, geographic, political, historical, or social significance. Participation in military training exercises, involvement in service learning, and attendance at cultural events may be part of the immersion experience. Cadets write reflective essays, keep personal/public journals, complete task-based writing assignments, deliver briefings, and produce research papers. A department instructor may conduct a site visit while cadets are abroad.                                                                                                                                                                                                                  |                                          | 2026-1 2026-2 2029-1<br>2029-2                     |

| This course aims to develop entry-level oral proficiency in Hebrew (approx. 800 words), the ability to read printed Hebrew for all vocabulary covered, and the ability to write simple sentences in Hebrew. Most of the course work will be oral.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                          | 2027-2 2028-2                                      |

| In the standard course, cadets acquire a basic proficiency in speaking, listening, reading, and writing skills in Japanese. Learning activities focus on situations cadets are likely to encounter in the target society. Cadets are taught how to express simple ideas and basic needs and minimum courtesy in areas of immediate need or familiar topics, comprehend the language in everyday contexts, and read simplified texts and brief, authentic selections. Although instruction places greater emphasis on reading, listening, and speaking skills, Cadets also learn how to write simple statements on familiar topics by hand and by typing. Through readings and discussions, Cadets are introduced to the culture, history, and geography of the Japanese-speaking world. Cadets acquire a command of basic Japanese vocabulary and gain a general understanding of how the language works and how to apply that knowledge when learning other foreign |                                          | 2026-2 2029-2                                      |

languages. Cadets also learn military terminology important to the Japanese Self Defense Force and the roles and responsibilities of the JSDF. The course will only be taught when resources are available.

**Lessons:** 30 @ 75 min (2.000 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** Cadets must complete two semesters of foreign language study at USMA prior to taking this elective. This course requires special permission from the DEWL Department Head.

**Scope:** 2025-1

**Offerings:**

LN487 and LN488 are essentially honors or tutorial courses available only to exceptionally motivated and qualified cadets who have exhausted all other language-specific courses and who wish to pursue a special field of interest in language, linguistics or a language-related field. The minimum completion requirement is a term paper, based on individual research of a length and on a topic upon which instructor and cadet have agreed.

| In this capstone course concentrators integrate their knowledge of Arabic language and culture of the Arabic-speaking world with other aspects of the curriculum. They attend lectures, participate in seminar discussions and complete a project of international import. Cadets develop a regionally focused topic, complete research and present findings for possible application at the joint command level. They make use of their acquired language skills while completing a course that is interdisciplinary in nature and meets academic program goals.    |                                           | 2026-2 2027-2 2028-2<br>2029-2                    |

| In this capstone course concentrators integrate their knowledge of French language and culture of the French-speaking world with other aspects of the curriculum. They attend lectures, participate in seminar discussions, and complete a project of international import. Cadets develop a regionally focused topic, complete research and present findings for possible application at the joint command level. They make use of their acquired language skills while completing a course that is interdisciplinary in nature and meets academic program goals.   |                                           | 2026-2 2027-2 2028-2<br>2029-2                    |

In this capstone course concentrators integrate their knowledge of Portuguese language and culture of the Portuguese-speaking world with other aspects of the curriculum. They attend lectures, participate in seminar discussions and complete a project of international import. Cadets develop a regionally focused topic, complete research and present findings for possible application at the joint command level. They make use of their acquired language skills while completing a course that is interdisciplinary in nature and meets academic program goals.

**Lessons:** 40 @ 55 min (2.500 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** None

**Prerequisite(s):** LP475

| <p>In the standard course sequence, Cadets acquire a basic proficiency in speaking, listening, reading and writing skills in Portuguese. Learning activities focus on situations Cadets are likely to encounter in Portuguese society. Cadets are taught how to express simple ideas and basic needs, comprehend the language in everyday contexts, and read simplified texts and brief, authentic selections. In addition to speaking, listening and reading skills, Cadets learn how to write sentences, paragraphs and/or short compositions on familiar topics. Through readings and discussions, Cadets are introduced to the cultures and history of the Portuguese-speaking world. Cadets acquire a command of basic Portuguese vocabulary and gain a general understanding of how the language works, and they become able to apply that knowledge when learning other foreign languages.</p> <p><b>Lessons:</b> 80 @ 55 min (5.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> None</p>                                                                                                                                                                                                                                                                                                                                 |                                       | 2026-1 2027-1 2028-1<br>2029-1                    |

| <p>In the intensive intermediate course, cadets develop proficiency in those skills necessary for communicating effectively in Portuguese and for pursuing upper-level courses. Cadets develop speaking skills that enable them to engage in conversations on a variety of topics with other class members and with native speakers. Cadets reinforce and expand their language skills by reading, viewing, discussing, and writing about contemporary life, current events, and other cultural and historical topics as presented in selected materials of the Portuguese-speaking world. In addition, cadets gain an overview of the profession of arms in Portuguese-speaking regions by reading, discussing, and writing about pertinent materials that focus on the mission and history of the military in those countries. Cadets also review the basic rules of Portuguese grammar and continue to acquire a corpus of Portuguese vocabulary. They will be able to use computer-assisted learning resources to strengthen and maintain their language proficiency. This course serves as a bridge to advanced elective Portuguese courses.</p> <p><b>Lessons:</b> 80 @ 55 min (5.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> None</p> <p><b>Prerequisite(s):</b> LP204</p> <p><b>Disqualifier(s):</b> LP361 LP362</p> |                                       | 2026-1 2027-1 2028-1<br>2029-1                    |

| <p>This course addresses students' specific needs in the development of listening, speaking, reading, and writing skills in Portuguese. Cadets expand their active vocabulary, gain greater command of complex grammatical structures, and develop appropriate styles of written and oral communication. Special emphasis is placed on conversational and expository speaking. Cadets increase their oral proficiency through dialogues, role play, group discussions, formal presentations, and simulations of everyday language tasks likely to be encountered in the target region. Guided writing activities develop Cadets' competence in the application of critical language structures. Listening and reading comprehension are strengthened via engagement with film, music, short stories, news reports, and other popular media. Course topics typically focus on regional culture, the military, and society.</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> None</p> <p><b>Prerequisite(s):</b> LP371</p>                                                                                                                                                                                                                                                                    |                                       | 2026-2 2027-2 2028-2<br>2029-2                    |

| In this course cadets enhance their reading and writing skills through study and discussion of contemporary Portuguese media (e.g. the Internet, television, film, radio, newspapers and magazines), as well as short literary selections. Reading strategies and textual analysis are addressed. Writing tasks develop organization, substance, and style. Graded work typically includes oral and written summaries of authentic texts and short compositions or reaction papers. The course is conducted in Portuguese.                                                                                                                                                                                                     |                                       | 2026-1 2027-1 2028-1 2029-1                        |

| Cadets gain an understanding of the profession of arms in the Portuguese-speaking world through lectures and selected reading materials (e.g. journal articles, Internet media, training manuals, biographies, and historical documents). Course content may encompass the mission and role, training, operations, tactics, and organization of the armed forces. Oral proficiency is enhanced through in-class discussion as well as role-plays and simulations focusing on scenarios likely to be encountered while an officer is deployed in a Portuguese-speaking region. Media complement instruction. Graded work may include briefings, role-plays, and simulation. The course is conducted in Portuguese.              |                                       | 2026-2 2027-2 2028-2 2029-2                        |

| This course constitutes an integrated study of the culture, history, and geography of Portugal and the Lusophone countries. Readings, lectures, discussions, and audio-visual materials encompass the representative artistic and intellectual accomplishments, political institutions, economy, and popular culture of those regions. In addition, the course focuses on the values and attitudes, the customs and traditions, and the social structures of the Portuguese-speaking people. At the same time, cadets continue to develop greater proficiency in Portuguese. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in Portuguese. |                                       | 2027-1 2028-1                                      |

In addition, the course focuses on the values and attitudes, the customs and traditions, and the social structures of the Brazilian people. At the same time, cadets continue to develop greater proficiency in Portuguese. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in Portuguese.                                                |                                       | 2026-2 2027-2 2028-2 2029-2                        |

| In this course cadets gain basic competence in the knowledge and comprehension of representative Brazilian and Portuguese short stories and of their relationship to the cultural contexts of Brazilian and Portuguese society. At the same time, cadets continue to develop greater language proficiency. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in Portuguese.                                                                                                                                                                                                                                                                                                                                                                                                                       |                                       | 2027-1 2028-1                                     |

| Cadets develop competence in the knowledge and comprehension of representative Portuguese and Brazilian literary works and their relationship to the cultural contexts of Portuguese and Brazilian society. Selected examples of various literary genres are read, discussed, and analyzed. At the same time, cadets continue to develop greater language proficiency. Video and film presentations supplement readings, where possible. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in Portuguese.                                                                                                                                                                                                                                                                                         |                                       | 2026-2 2027-2 2028-2                              |

| In the standard course sequence, Cadets acquire a basic proficiency in speaking, listening, reading and writing skills in Russian. Learning activities focus on situations Cadets are likely to encounter in Russian society. Cadets are taught how to express simple ideas and basic needs, comprehend the language in everyday contexts, and read simplified texts and brief, authentic selections. In addition to speaking, listening and reading skills, Cadets learn how to write sentences, paragraphs and/or short compositions on familiar topics. Through readings and discussions, Cadets are introduced to the cultures and history of the Russian-speaking world. Cadets acquire a command of basic Russian vocabulary and gain a general understanding of how the language works, and they become able to apply that knowledge when learning other foreign languages. |                                       | 2026-1 2027-1 2028-1<br>2029-1                    |

| In the intensive intermediate course, cadets develop proficiency in those skills necessary for communicating effectively in Russian and for pursuing upper-level courses. Cadets develop speaking skills that enable them to engage in conversations on a variety of topics with other class members and with native speakers. Cadets reinforce and expand their language skills by reading, viewing, discussing, and writing about contemporary life, current events, and other cultural and historical topics as presented in selected materials of the Russian-speaking world. In addition, cadets gain an overview of the profession of arms in Russian-speaking regions by reading, discussing, and writing about pertinent materials that focus on the mission and history of the military in those countries. Cadets also review the basic rules of Russian grammar and continue to acquire a corpus of Russian vocabulary. They will be able to use computer-assisted learning resources to strengthen and maintain their language proficiency. This course serves as a bridge to advanced elective Russian courses. |                                         | 2026-1 2027-1 2027-8<br>2028-1 2028-8 2029-1      |

| This course addresses students' specific needs in the development of listening, speaking, reading, and writing skills in Russian. Cadets expand their active vocabulary, gain greater command of complex grammatical structures, and develop appropriate styles of written and oral communication. Special emphasis is placed on conversational and expository speaking. Cadets increase their oral proficiency through dialogues, role play, group discussions, formal presentations, and simulations of everyday language tasks likely to be encountered in the target region. Guided writing activities develop Cadets' competence in the application of critical language structures. Listening and reading comprehension are strengthened via engagement with film, music, short stories, news reports, and other popular media. Course topics typically focus on regional culture, the military, and society.                                                                                                                                                                                                          |                                         | 2026-2 2027-2 2028-2<br>2029-2                    |

| In this course cadets enhance their reading and writing skills through study and discussion of contemporary Russian media (e.g. the Internet, television, film, radio, newspapers and magazines), as well as short literary selections. Reading strategies and textual analysis are addressed. Writing tasks develop organization, substance, and style. Graded work typically includes oral and written summaries of authentic texts and short compositions or reaction papers. The course is conducted in Russian.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                         | 2026-1 2027-1 2027-8<br>2028-1 2028-8 2029-1      |

Cadets gain an understanding of the profession of arms in the Russian-speaking world through lectures and selected reading materials (e.g. journal articles, Internet media, training manuals, biographies, and historical documents). Course content may encompass the mission and role, training, operations, tactics, and organization of the armed forces. Oral proficiency is enhanced through in-class discussion as well as role-plays and simulations focusing on scenarios likely to be encountered while an officer is deployed in a Russian-speaking region. Media complement instruction. Graded work may include briefings, role-plays, and simulation. The course is conducted in Russian.

**Lessons:** 40 @ 55 min (2.500 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** None

**Scope:** 2025-1

**Offerings:**

This course constitutes an integrated study of the culture, history, and geography of Russia and the Soviet Union from its beginnings to the end of World War II. Readings, lectures, discussions, and audio-visual materials encompass this civilization's representative artistic and intellectual accomplishments, its political institutions, economy, and popular culture. In addition, the course focuses on the values and attitudes, the customs and traditions, and the social structures in Russia. At the same time, cadets continue to develop greater language proficiency. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in Russian.

**Scope:** 2025-1

**Offerings:**

This course is a survey of Russian literature, tracing its development from the early 19th century to the beginning of WWI. Cadets gain basic competence in the knowledge and comprehension of representative literary works and their relationship to the cultural context of Russian society. Selected examples of various literary genres are read, discussed, and analyzed. At the same time, cadets continue to develop greater language proficiency. Video and film presentations supplement readings, where possible. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in Russian.

Cadets develop competence in the knowledge and comprehension of representative Russian literary works and their relationship to the cultural context of Russian society. Selected examples of various literary genres are read, discussed, and analyzed. At the same time, cadets continue to develop greater language proficiency in the Russian language. Video and film presentations supplement readings. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in Russian.

|---------------|--------|-------------------|

In the standard course sequence, cadets acquire a basic proficiency in speaking, listening, reading and writing skills in Spanish. Learning activities focus on situations Cadets are likely to encounter in Spanish society. Cadets are taught how to express simple ideas and basic needs, comprehend the language in everyday contexts, and read simplified texts and brief, authentic selections. In addition to speaking, listening and reading skills, Cadets learn how to write sentences, paragraphs and/or short compositions on familiar topics. Through readings and discussions, Cadets are introduced to the cultures and history of the Spanish-speaking world. Cadets acquire a command of basic Spanish vocabulary and gain a general understanding of how the language works, and they become able to apply that knowledge when learning other foreign languages.

|---------------|--------|-------------------|

In the intensive intermediate course, cadets develop proficiency in those skills necessary for communicating effectively in Spanish and for pursuing upper-level courses. Cadets develop speaking skills that enable them to engage in conversations on a variety of topics with other class members and with native speakers. Cadets reinforce and expand their language skills by reading, viewing, discussing, and writing about contemporary life, current events, and other cultural and historical topics as presented in selected materials of the Spanish-speaking world. In addition, cadets gain an overview of the profession of arms in Spanish-speaking regions by reading, discussing, and writing about pertinent materials that focus on the mission and history of the military in those countries. Cadets also review the basic rules of Spanish grammar and continue to acquire a corpus of Spanish vocabulary. They will be able to use computer-assisted learning resources to strengthen and maintain their language proficiency. This course serves as a bridge to advanced elective Spanish courses.

|--------------|-----------------------------------------|----------------------------------------------------------|

---

**Scope:** 2025-2

**Offerings:**

This course addresses students' specific needs in the development of listening, speaking, reading, and writing skills in Spanish. Cadets expand their active vocabulary, gain greater command of complex grammatical structures, and develop appropriate styles of written and oral communication. Special emphasis is placed on conversational and expository speaking. Cadets increase their oral proficiency through dialogues, role play, group discussions, formal presentations, and simulations of everyday language tasks likely to be encountered in the target region. Guided writing activities develop Cadets' competence in the application of critical language structures. Listening and reading comprehension are strengthened via engagement with film, music, short stories, news reports, and other popular media. Course topics typically focus on regional culture, the military, and society.

| <p>In the standard course sequence, Cadets acquire a basic proficiency in speaking, listening, reading and writing skills in Persian. Learning activities focus on situations Cadets are likely to encounter in Persian society. Cadets are taught how to express simple ideas and basic needs, comprehend the language in everyday contexts, and read simplified texts and brief, authentic selections. In addition to speaking, listening and reading skills, Cadets learn how to write sentences, paragraphs and/or short compositions on familiar topics. Through readings and discussions, Cadets are introduced to the cultures and history of the Persian-speaking world. Cadets acquire a command of basic Persian vocabulary and gain a general understanding of how the language works, and they become able to apply that knowledge when learning other foreign languages.</p> <p><b>Lessons:</b> 80 @ 55 min (5.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b>                      None</p>                                                                                                                                                                                                                                                                                                               |                                         | 2026-1 2027-1 2028-1<br>2029-1                    |

| <p>In the intensive intermediate course, cadets develop proficiency in those skills necessary for communicating effectively in Persian and for pursuing upper-level courses. Cadets develop speaking skills that enable them to engage in conversations on a variety of topics with other class members and with native speakers. Cadets reinforce and expand their language skills by reading, viewing, discussing, and writing about contemporary life, current events, and other cultural and historical topics as presented in selected materials of the Persian-speaking world. In addition, cadets gain an overview of the profession of arms in Persian-speaking regions by reading, discussing, and writing about pertinent materials that focus on the mission and history of the military in those countries. Cadets also review the basic rules of Persian grammar and continue to acquire a corpus of Persian vocabulary. They will be able to use computer-assisted learning resources to strengthen and maintain their language proficiency. This course serves as a bridge to advanced elective Persian courses.</p> <p><b>Lessons:</b> 80 @ 55 min (5.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b>                      None</p> <p><b>Prerequisite(s):</b>                                LZ204</p> |                                         | 2026-1 2027-1 2028-1<br>2029-1                    |

| <p>This course addresses students' specific needs in the development of listening, speaking, reading, and writing skills in Persian. Cadets expand their active vocabulary, gain greater command of complex grammatical structures, and develop appropriate styles of written and oral communication. Special emphasis is placed on conversational and expository speaking. Cadets increase their oral proficiency through dialogues, role play, group discussions, formal presentations, and simulations of everyday language tasks likely to be encountered in the target region. Guided writing activities develop Cadets' competence in the application of critical language structures. Listening and reading comprehension are strengthened via engagement with film, music, short stories, news reports, and other popular media. Course topics typically focus on regional culture, the military, and society.</p> <p><b>Lessons:</b> 40 @ 55 min (2.500 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b>                      None</p> <p><b>Prerequisite(s):</b>                                LZ371</p>                                                                                                                                                                                                          |                                         | 2026-2 2027-2 2028-2<br>2029-2                    |

Cadets strengthen their reading and writing proficiency through study and discussion derived from contemporary Persian media (e.g., Internet, film, newsprint and magazines) and short literary selections. Reading strategies and textual analysis are introduced and practiced. Writing tasks address organization, substance and grammatical accuracy. Graded work typically includes oral and paragraph-length written summaries of Persian texts and short compositions or reaction papers.

Cadets gain an understanding of the profession of arms in the Persian-speaking world through lectures and selected reading materials (e.g. journal articles, Internet media, training manuals, biographies, and historical documents). Course content may encompass the mission and role, training, operations, tactics, and organization of the armed forces. Oral proficiency is enhanced through in-class discussion as well as role-plays and simulations focusing on scenarios likely to be encountered while an officer is deployed in a Persian-speaking region. Media complement instruction. Graded work may include briefings, role-plays, and simulation. The course is conducted in Persian.

This course constitutes an integrated study of the culture, history, and geography of the old Persian Empire from their beginnings in the first millennium BCE to the formation of the modern nation-states of Afghanistan, Iran, and Tajikistan in the 16th century. Readings, lectures, discussions, and audio and visual materials encompass this civilization's representative artistic and intellectual accomplishments, its present-day political institutions, economy, and popular culture. In addition, the course focuses on the values and attitudes, the customs and traditions, and the social structures of the people of Afghanistan, Iran, and Tajikistan. At the same time, cadets continue to develop greater language proficiency. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in Persian.

This course is a survey of Persian literature that has impacted Iranian politics, cultural discourse, and the collective Persian memory from the Middle Ages through the 19th century. Cadets gain a basic competence in the knowledge and comprehension of representative literary works and their relationship to the cultural context of Iranian society. Selected examples of various literary genres are read, discussed, and analyzed. At the same time, cadets continue to develop greater language proficiency. Video and film presentations supplement readings, where possible. Graded work may include giving oral presentations, writing short essays, or preparing a term paper. A majority of the work is done in Persian.

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** None

**Prerequisite(s):** LZ372

This remedial course teaches cadets basic critical reading and writing skills necessary to communicate successfully across academic disciplines and as officers within the Army profession. In addition to teaching and reinforcing grammatical correctness, argument organization, and written clarity, WR200 encourages cadets to take ownership of their development as writers and communicators. Through intensive instruction and practical exercise, cadets will hone tools essential to their continued development as writers of clear, logical, correct, and compelling writing.

WR303 is the gateway seminar for the WPWP's Writing Fellows Program. The course consists of three main components: seminar-based examinations of significant scholarship in college composition and its pedagogy, individual mentorships with faculty across the disciplines, and teaching practica in the form of peer-to-peer consultations in the Mounger Writing Center. Cadets develop jointly as scholars and teachers by researching the craft of writing and communication in academic as well as professional environments; by contributing originally to high-level scholarly conversations; and above all, by collaborating to develop further resources for thinking, writing, and communicating that benefit all West Pointers.

**Lessons:** 40 @ 55 min (2.500 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Enrollment by invitation only. As part of the course, cadets conduct peer consultations in the Mounger Writing Center.

**Offerings:**

WR313 is the advanced seminar for the WPWP's Writing Fellows Program. Similar to the Program's gateway seminar (WR303), the course focuses on seminar-based examinations of significant scholarship in college composition and its pedagogy as well as teaching practica, mainly in the form of peer-to-peer consultations in the Mounger Writing Center. Cadets revise and build upon major assignments in WR303 while also completing independent projects that seek to make permanent contributions to writing and communications education at the Academy.

| <p>This core course provides cadets with a fundamental understanding of scientific principles and processes of earth science, meteorology, climatology, geomorphology and environmental systems, as well as an introduction to cultural geography. Further, the course introduces cadets to technical skills - (terrain analysis, image interpretation and spectral analysis, remote sensing, global positioning system, geographic information systems cartography) - to delineate the geographic distribution of landforms, weather, climate, and culture systems; and evaluate their potential impact on military operations. Lessons are reinforced by use of in- and out-of-class practical exercises, terrain walks and computer exercises to demonstrate the interrelationship between physical and human processes, and their impact on the environment. Historical and contemporary vignettes are employed to demonstrate how weather, climate, terrain, soils, vegetation and culture are important, cogent and frequently decisive in military operations.</p> |                                                                                                                                                                                                      | 2026-1 2026-2 2026-5<br>2027-1 2027-2 2027-5<br>2028-1 2028-2 2028-5<br>2029-1 2029-2 2029-5 |

| <p>This course presents the basic concepts, theories and methods of inquiry in the discipline of geography as foundation for advanced study in Human/Regional Geography; Environmental Geography; or Geospatial Information Science. The course includes models and concepts from the many sub-disciplinary (systematic) areas of geography to include cultural, historical, economic, urban, political and military geography. The application of concepts to real-world issues is emphasized. Research skills and techniques used by professional geographers are presented. Cadets use these approaches to spatially analyze and map the distribution of human and environmental phenomena. Several short papers will be assigned.</p>                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                      | 2026-1 2027-1 2028-1<br>2029-1                                                               |

| <p>The course is an individually supervised research and study program designed to familiarize cadets with introductory scientific procedures, techniques, and topics. The cadet and advisor prepare a research and study proposal setting forth the objectives, scope, and anticipated accomplishments of his/her efforts for the semester. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Once approved, the proposal serves as a basis for the cadet's research and study program. Progress in research reports and observations by the faculty advisor form the basis for grades. Activities vary by project, but the primary purpose is to acquaint students with essential skills required for independent research. If required for a specific degree, the proposal will include a justification for engineering science or design credit.</p>                                                                                                                                 |                                                                                                                                                                                                      | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2                                |
| <b>Lessons:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 0 @ 0 min (0.000 Att/wk)                                                                                                                                                                             | <b>Labs:</b> 0 @ 0 min                                                                       |

GE300 course provides a broad, global perspective on environmental challenges and their impact on humanity and the species we share the planet with. It will examine critical global issues such as resource management, pollution, conservation, corporate social responsibility, community resilience, and innovative solutions for addressing these concerns. Through targeted discussions, debates, case study reviews, scientific literature, short papers, and media, cadets will explore how science, economics, policy, and social and ethical considerations intersect with global development goals. Applying responsible environmental and business practices helps restore ecosystem health, promotes resource stewardship, and enhances societal well-being. This course will begin to develop a comprehensive understanding of the environmental, economic, and social challenges we face with global resources in the coming decades.

**Lessons:** 30 @ 75 min (2.000 Att/wk)    **Labs:** 0 @ 0 min

**Scope:** 2026-1

**Offerings:**

This course introduces academic geographic inquiry and the methods, techniques, and ethical considerations needed to effectively design, plan, and conduct geographic research. The course starts with why research is important and the ethics of doing research, which includes an introduction to the institutional review board process. Cadets will then learn how to conduct and write a literature review and develop research questions. Finally, quantitative, qualitative and spatial methods will be introduced. This course is designed to be an applied introduction to geographical research techniques.

**Scope:** 2026-1

**Offerings:**

This course introduces basic theories and technologies of Geographic Information Systems (GIS), including the representation, acquisition, manipulation, analysis, and visualization of geographically related information. Used by environmentalists, engineers, land-use planners, architects, managers of large land holdings, and the military, these highly-intricate "decision support" systems assist managers in answering important "what if" questions. Hands-on experiences of GIS software are emphasized through lab and practical exercise applications.

|--------------|--------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

Climatology investigates the earth's atmospheric phenomena, giving special attention to the dynamic physical processes which produce weather and result in distinctive climates across the planet. A primary focus of the course is to examine how the climate system can impact humans, including an examination of human health, agriculture, and military operations. A similar emphasis is placed on ways in which humans can alter the climate through urbanization, pollution, and increasing greenhouse gas concentrations. Climate change policy and mitigation are also explored through scientific readings, and as differing viewpoints are presented, lively discussion and debate are encouraged. Numerous case studies are offered throughout the course, allowing students to apply climate data and information to problem solving in real-world situations.

| <p>This course introduces meteorological processes, systems, and patterns with emphasis on spatial distributions. The course begins with a comprehensive look at the structure of the atmosphere to include the energy budget, heat transfer mechanisms, as well as an examination of daily and seasonal patterns of temperature. A thorough look at atmospheric moisture and stability precedes a study of cloud and precipitation processes followed by a study of the atmosphere in motion, namely air pressure, governing forces, winds, small and local-scale wind systems and the general circulation of the planet. Specific phenomena are then examined, including mid-latitude cyclones, thunderstorms/lightning, tornadoes, severe thunderstorms, hurricanes, air pollution, and a brief look at climate and climate change. The end of the course focuses on the art and science of weather forecasting and its applicability to military operations. | <p>This course provides disciplinary depth in the science of oceans, estuaries, lakes, rivers, and water ecosystems through the study of physical, chemical and biological principles related to marine and freshwater biomes. Communities of marine and freshwater organisms at various ecological zones are explored, as they are affected by light, nutrients, water chemistry, and other physical and chemical properties. The impacts of humans on these water ecosystems are also evaluated. The course provides the student with a strong foundation in the science of the hydrosphere while introducing students to environmental science lab and field research methods.</p> |                                                                                                                                     | 2026-1 2027-1 2028-1<br>2028-2 2029-1 2029-2 |

| <p>This course studies the processes that create landforms on the surface of the earth and their regional and global distributions. The course focuses on processes and their inter-relationships with geologic structure, soils and climate. Processes emphasized include glaciers, streams, downslope motion caused by gravity, groundwater, coastlines, and eolian landscapes. Each student prepares a final report synthesizing these processes and how they relate to real-world applications.</p> |                                                                                      | 2026-2 2027-2 2028-2 |

| <p>This course primarily emphasizes learning to identify minerals and rocks and then applying this knowledge to analyze the significant geologic processes that act on and within the Earth. These processes include plate tectonics, rock mechanics, structural geology, geologic mapping, ground and surface water, deep time, and elements of mining and petroleum engineering. Field trips are conducted to illustrate how local geology influenced development and construction in the Hudson Valley. The course is capstoned by an open-ended geologic mapping project which requires the creative application of geology to propose a practical solution to a stated need. Cadets use a geologic exploration simulation to convert given resources into a product containing elements that professional geologists would create.</p> |                                                                                                                                     | 2026-1 2026-8 2027-1<br>2029-2                                                                                                 |

| <p>The geology field course is a three-week long summer Individual Advanced Development Program. It is taught at a variety of field locations as funding and travel opportunities allow, but always directly driven by the location's link to course concepts. Geologic concepts are initially presented in a classroom setting and supplemented with laboratory exercises. The majority of the course, however, is conducted at geologic sites in the field where concepts are illustrated and expanded. The course provides the cadet with knowledge of and appreciation for the science of geology as well as practical experience in geological mapping. Field trips to active mines and active geologic research locations relate classroom learning to the real world.</p>                                                            |                                                                                                                                     | 2026-7 2027-7 2028-7<br>2029-7                                                                                                 |

| <p>This course provides the geographic foundation for study in interdisciplinary and management academic areas. Contemporary regions of the world political map serve as the framework within which geographic concepts and analytical techniques are applied. Each cadet will develop an awareness of the diversity and distribution of people on the earth, human organization and exploitation of territory, and interactions among culture groups. Particular emphasis is placed on social institutions, their impact on economic development, and the subsequent identification and analysis of developed, emerging, and underdeveloped states.</p>                                                                                                                                                                                    |                                                                                                                                     | 2026-1 2026-2 2026-8<br>2026-9 2027-1 2027-2<br>2027-8 2027-9 2028-1<br>2028-2 2028-8 2028-9<br>2029-1 2029-2 2029-8<br>2029-9 |

| <p>This course provides a regional geography of North America, with balanced coverage of the human and physical geography of the United States and Canada. Lectures are appropriately supplemented with movies, slides, and maps to facilitate understanding of important themes that are prevalent in various subregions. Emphasis is placed on cultural patterns and contemporary environmental issues.</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> One oral report.</p> <p><b>Disqualifier(s):</b> EV384</p>                                                                                                                                                                                                                                   |                                     | 2027-1 2028-1 2029-1                                                                         |

| <p>This course examines the political, economic, and cultural geography of Russia and its adjacent neighbors; the Baltic states, east central European region, transcaucasus, and central Asia. Topics covered include: the commonwealth of independent states; ecocide in the former Soviet Union; disposition of the former soviet military; and ethnic rivalries. The objective of the course is to provide the student with an understanding of the recent past of the traditional soviet system in order to understand, as well as geographically evaluate, Russia's and the other former republics' situation today.</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> 1 field trip; one research paper.</p> <p><b>Disqualifier(s):</b> EV371</p> |                                     | 2026-1 2026-8 2026-9<br>2027-1 2027-8 2027-9<br>2028-1 2028-8 2028-9<br>2029-1 2029-8 2029-9 |

| <p>This course examines the cultural and natural diversity of African landscapes, with an emphasis on development, population issues, disease, and the origin, dispersal, spatial organization, and interaction of important cultural groups. Africa's physical landscapes will also be introduced as the palette upon which Africa's complex human mosaic has developed. Students will explore, from a geographic perspective, why Africa has seemingly been plagued with problems of economic development, health, and political instability.</p> <p><b>Lessons:</b> 15 @ 140 min (1.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> One written research report with brief oral presentation. | <p>This course examines the cultural and natural diversity of Southwest Asian landscapes. The realm's cultures and ethnicities are studied in a geographic context, with an emphasis on the origin, dispersal, spatial organization, and interaction of important cultural groups. Among issues examined are the distribution and strategic significance of critical mineral and energy resources, population and resource disparities, cultural conflict, and economic development. Students will learn how geographic issues impact the prospects for peace and stability in the region.</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p>                                                                                                                                            |                                     | 2026-1 2026-8 2026-9<br>2027-1 2027-8 2027-9<br>2028-1 2028-8 2028-9<br>2029-1 2029-8 2029-9 |

| The course examines European cultural landscapes, focusing on the environmental and cultural diversity exhibited among the states of modern Europe. Nationalism and the territorial imperative, long recognized as major forces in Europe, are studied from a geographic perspective to include patterns and processes of both regional continuity and change. Emphasis is given to the rapidly developing urbanization and mutual interdependence among countries of Western Europe. West and East European agricultural/industrial resource bases and developmental strategies are compared and contrasted. Specific topics are tailored to current issues and include regional conflict, economic development and trade, and problems of energy and the environment. This course concludes with a study of contemporary European extraregional spatial relationships with other major world culture regions. |        | 2026-2 2026-8 2026-9<br>2027-2 2027-8 2027-9<br>2028-2 2028-8 2028-9<br>2029-2 2029-8 2029-9 |

| This course studies the physical and cultural landscape of Latin America, giving special treatment to the diversity and cultural identity of the region. Topics covered include an historical geography of the region, including pre-columbian civilizations, Iberian, African, and European influences; the geography of transportation networks, agriculture, urbanization, and population. National boundaries, major landforms and climatic conditions are discussed to describe their effect on civilization. This course also investigates the historical relationship between the United States and Latin America and covers recent U.S. military interventions in the region. |        | 2026-1 2026-8 2026-9<br>2027-1 2027-8 2027-9<br>2028-1 2028-8 2028-9<br>2029-1 2029-8 2029-9 |

| An introduction to land use planning and management with focus on the land-law interfaces between the physical, cultural, and legal realms. The course surveys the policies and legislative basis for land use controls at the local, federal and regional levels to include national parks and forests, agricultural lands, rangelands, and military training areas. Natural resource management issues and strategies are explored. The importance of geographic concepts is emphasized in the conduct of applied case studies addressing land use conflicts and environmental strategies. |        | 2026-1 2027-1 2028-1<br>2029-1 |

| This course examines the location, function, structure, growth and interaction of urban areas. Spatial techniques are used to explore the internal attributes of cities, as well as their connectivity to other places. While the primary focus is on urbanization in the United States, primate cities abroad are often used for comparative purposes. Emphasis is placed on contemporary urban problems, particularly environmental issues and social disparities. |        | 2026-2 2026-8 2027-2<br>2028-2 2029-2 |

|--------------|---------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

This course focuses on natural phenomena that pose hazards to people. The cause, nature, and occurrence frequency of natural hazards such as flooding, earthquakes, hurricanes, and volcanic activity will be examined. Emphasis will also be placed on how people perceive and respond to these hazards. Land use policies and practices in these hazard areas will also receive attention. Students participate in map based laboratory exercises and have the opportunity to write a short paper advising a government official how to mitigate local geohazards.

|--------------|-----------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

Remote Sensing is collecting information about something without being in physical contact with it. In this course, students will learn remote sensing principles that are applicable across engineering and humanities disciplines. The focus of the course is the electro-magnetic spectrum and how it is leveraged to collect information about a surface. Through lectures and practical exercises students will become familiar with different remote sensing applications, technologies, and the physical basis of satellite and aerial remote sensing. Pertinent to this study is a basic understanding of orbital mechanics, data analysis, and sensor design. The course will help students apply remotely sensed data to solve current problems.

**Scope:** 2026-1

**Offerings:**

Cartography covers theoretical concepts and practical aspects for visualizing and analyzing digital spatial data. The course covers the principles of cartographic communication and enables the student to apply map design principles along with computer mapping techniques to solve contemporary problems in geography, economics, international relations, and applied sciences. A final course design project requires the student to utilize various online resources to obtain open-source geodata and demonstrate their ability to synthesize sound mapping principles.

|--------------|-----------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

Photogrammetry relates the principles of photography, precise image measurement, and computation for the development of accurate spatial information. Photogrammetry is heavily utilized in the public, private, and defense sectors for the creation of high-resolution maps, three-dimensional (3D) models, and for detailed geometric analyses (e.g., change detection associated with imaged objects or the surface of the Earth). This course covers the fundamentals of optics, photography, image measurement, coordinate transformations, calculating geometry from vertical and tilted aerial imagery, stereoscopic visualization, photogrammetric control and flight mission planning, and the development of geospatial products such as digital surface models (DSM), 3D point clouds, and orthorectified basemaps. Laboratory exercises and a final project provide practical hands-on experience with topics ranging from photogrammetric analysis of historical film imagery to the creation of digital 3D point clouds and surfaces using unmanned aircraft systems (UAS) and modern digital cameras.

| <b>GE380</b> | <b>SURVEYING</b> | <b>3.5 Credit Hours</b><br><b>(BS=0.5,ET=3.0,MA=0.0)</b> |
|--------------|------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

A framework for understanding and applying practical surveying methods is developed. Consideration of error theory and the concepts of precision and accuracy yields understanding of the probabilistic nature of measurements. The principles of differential leveling, electronic distance measurement, angular measurement, global navigation satellite system (GNSS) positioning, and terrestrial laser scanning (a.k.a. Lidar) are studied and applied using state-of-the-art surveying equipment and software tools. Plane surveys are principally explored, although the fundamentals of geodetic surveys are also presented. Traverse, triangulation, trilateration, level networks and the proper adjustment of related measurements are examined. Control survey, land survey, topographic survey, horizontal and vertical curve design, and Geographic Information System (GIS) software applications are included. Extensive use of laboratory periods permits the application of surveying fundamentals, methods and planning skills to actual field situations.

**Scope:** 2026-1

**Offerings:**

The course is an individually supervised research and study program designed to familiarize cadets with advanced scientific procedures, techniques, and topics. The cadet and advisor prepare a research and study proposal setting forth the objectives, scope, and anticipated accomplishments of his/her efforts for the semester. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Once approved, the proposal serves as a basis for the cadet's research and study program. Progress in research reports and observations by the faculty advisor form the basis for grades. Activities vary by project, but the primary purpose is to acquaint students with essential skills required for independent research. If required for a specific degree, the proposal will include a justification for engineering science or design credit.

| <b>Scope:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 2026-1                                                                                                                                                                                               | <b>Offerings:</b>                                             |
| <p>The course is an individually supervised research and study program designed to familiarize cadets with advanced scientific procedures, techniques, and topics. The cadet and advisor prepare a research and study proposal setting forth the objectives, scope, and anticipated accomplishments of his/her efforts for the semester. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Once approved, the proposal serves as a basis for the cadet's research and study program. Progress in research reports and observations by the faculty advisor form the basis for grades. Activities vary by project, but the primary purpose is to acquaint students with essential skills required for independent research. If required for a specific degree, the proposal will include a justification for engineering science or design credit.</p> |                                                                                                                                                                                                      | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| <p>This course examines ecosystems through the study of ecological principles related to an organism's relationship to its environment, community, and ecosystem. Species, population, community, and ecosystem level interactions and dynamics are emphasized. The fundamental influences of energy flow and material cycling are examined, as well as the unique role of wetlands within ecosystems. The course includes several field trips, which lead to a culminating term project designed to integrate previously acquired environmental science technical skills and ecological principles.</p>                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                      | 2026-1 2027-1 2028-1<br>2029-2                                |

| <p>This course looks at how the environment and development are closely connected. It explores the ways environmental conditions shape development choices and how development efforts, in turn, affect the environment. While physical geographers tend to focus on natural systems and processes, and human geographers study how people use space, this course brings those approaches together. It emphasizes how communities respond to environmental limits and how their development decisions can change landscapes and ecosystems. To make sense of these relationships, students will study natural processes like land formation and climate, as well as the social, economic, and political forces that drive development.</p>                                                                                                                                                                                            |                                                                                                                                                                                                      | 2026-2 2028-2 2029-2                                          |

This course examines advanced remote sensing theory and digital image processing techniques suitable for the processing of remotely sensed data. Emphasis is on the processing and analysis of state-of-the-art high spatial and spectral resolution data gathered by airborne and satellite sensors. Topics covered include geometric and radiometric image rectification, registration and resampling techniques, image enhancements, data merging, image segmentation, and automated feature extraction. A wide range of practical exercises and in-class laboratory assignments provides hands-on experience with a variety of remotely sensed imagery ranging from multi-spectral to hyper-spectral data. The course culminates with a capstone term project that allows cadets to apply digital image processing skills to a scientific problem.

**Scope:** 2026-1

**Offerings:**

This course is designed to teach the most current state of geospatial operations in the military. It is built to provide the student an improved understanding of the cornerstone to the digital force - the "common operational picture" or COP. This course is divided into five major blocks of instruction: (1) a linked discussion of geospatial operations' development, organizations and data systems; (2) the geographic information system (GIS) as a military tool - system input, management, data analysis and production outputs; (3) Army geospatial operations in the garrison environment; (4) Army geospatial operations in combat environments; and (5) geospatial operations for joint/coalition forces. The course includes several relevant practical exercises and laboratories, a field trip, guest lectures and one panel discussion. Due to the currency of the material discussed a secret security clearance is required for all participants.

---

**Scope:** 2026-1

**Offerings:**

This course explores an advanced topic in Human and Regional Geography, Environmental Geography, Environmental Science, or Geospatial Science. Specific subject matter will vary with the expertise of the visiting professor or senior faculty member conducting the course.

2026-2

**Lessons:** 15 @ 140 min (1.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** As specified by the professor. The program director will determine the applicable amount MA, BS and ET credit for each course offering, when required.

**Prerequisite(s):** EV203  
-Or-  
GE203

**Disqualifier(s):** EV485

---

**Scope:** 2026-1

**Offerings:**

History is replete with examples of the impact of terrain, weather and climate on military operations at all scales. National strategies are influenced heavily by geographic realities of relative location, spatial interaction, population dynamics and resource distribution. This course emphasizes the development of a geographic method for systematic analysis of the battlefield that is appropriate for platoon leader and corps commander alike. Students evaluate the elements of national power and examine their geostrategic influences, past and present. The role of the environment in shaping today's Army and its missions is discussed. Jungle, cold region, alpine, riverine, desert, temperate and urban operational environments are examined for their effect on military planning and execution. Finally, cadets review case studies of the impact of these diverse environments on military operations at the tactical level.

**Scope:** 2026-1

**Offerings:**

This interdisciplinary seminar uses Environmental Security in a case study approach to analyze how environmental issues affect U.S. National Security. Cadets explore environmental security topics such as water, natural resource shortages, energy use and dependency, and global climate change using an interdisciplinary approach from social, political, economic, and scientific-technological perspectives. The course culminates in a student team analysis of a developing country relating environmental security issues to U.S. National Security interests. The final project includes a formal brief and written paper.

---

**Scope:** 2026-1

**Offerings:**

This course will examine major research initiatives in the discipline and delineate their data requirements. The primary objective of this course is to identify and outline the senior thesis, which is the culminating event for the Honors Program. Hence, cadets participating in this course will explore research methods and data sources used by geographers, conduct a critical analysis of seminal literature in the field, define a research problem, identify and evaluate data sources, and assemble a research proposal. The final product of this course will be a written research proposal that will define the senior thesis (written during GE499A). The cadet will make a formal presentation of this proposal to senior geography faculty. The course is conducted in a seminar and one-and-one format. Lessons and labs are established by consultation between the cadet and faculty advisor.

**Scope:** 2026-1

**Offerings:**

The colloquium is a directed readings course using small group discussions of important literature, methodological traditions, and contemporary research trends in the field of geography. Dependent on instructor preference and individual student interest, in-depth readings will be pursued in one or more of the following areas of geographic study: cultural, political, regional or military geography. Compensatory time is given to permit extra readings.

| <p>This course examines the analytical methods used in Geographic Systems (GS) and provides cadets with a clear understanding of the theoretical/conceptual aspects of algorithms found in GS software. Lectures focus on the underlying mathematical basis for widely used spatial analytical techniques. Among the topics covered are neighborhood operations, map transformation, spatial interpolation, terrain analysis, network analysis, spatial overlay, fuzzy sets, neural networks, and expert systems. In-class practical exercises and laboratory assignments compliment the lectures by providing hands-on experience with a variety of advanced analytical techniques. The course culminates with a capstone term project that allows cadets to identify a scientific problem, formulate a hypothesis, use GS to solve the problem, and then present the results of their analysis.</p> |                                           | 2026-1 2026-8 2027-1<br>2028-1 2029-1 |

| <p>The course is an individually supervised research and study program designed to provide cadets the opportunity to pursue advanced scientific procedures, techniques, and/or topics within their discipline. The cadet and faculty advisor prepare a research proposal setting forth the objectives, scope, and anticipated accomplishments of his/her efforts for the semester. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Once approved, the proposal serves as a basis for the cadet's research and study program. Progress in research reports and observations by the faculty advisor form the basis for grades. Lessons and labs are established by consultation between the cadet and faculty advisor. The program for each cadet will culminate in one of two outcomes: 1) discipline-appropriate final written report (e.g., senior thesis) with presentation in a public forum (e.g., Projects Day); or 2) enrollment in GE499B for continued research and independent study at a 3.0-credit level. If required for a specific degree, the proposal will include a justification for engineering science or design credit. Program Director will determine the applicable MA, BS, and ET credits for each offering, as required.</p> |                                                                                                                                                                                                                                     | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| <p>The course is an individually supervised research and study program designed to provide cadets the opportunity to pursue advanced scientific procedures, techniques, and/or topics within their discipline. The cadet and faculty advisor prepare a research proposal setting forth the objectives, scope, and anticipated accomplishments of his/her efforts for the semester. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Once approved, the proposal serves as a basis for the cadet's research and study program. Progress in research reports and observations by the faculty advisor form the basis for grades. Lessons and labs are established by consultation between the cadet and faculty advisor. The program for each cadet will culminate in one of two outcomes: 1) discipline-appropriate final written report (e.g., senior thesis) with presentation in a public forum (e.g., Projects Day); or 2) enrollment in EV489C for continued research and independent study at a 3.0-credit level. If required for a specific degree, the proposal will include a justification for engineering science or design credit. Program Director will determine the applicable MA, BS, and ET credits for each offering, as required.</p> |                          | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| <p>This course provides the geographic foundation for study in interdisciplinary and management academic areas. Contemporary regions of the world political map serve as the framework within which geographic concepts and analytical techniques are applied. Each cadet will develop an awareness of the diversity and distribution of people on the earth, human organization and exploitation of territory, and interactions among culture groups. Particular emphasis is placed on social institutions, their impact on economic development, and the subsequent identification and analysis of developed, emerging, and underdeveloped states.</p>                                     |                                                                                       | No Course Offerings                                |

| <p>This course studies the physical and cultural landscape of Latin America, giving special treatment to the diversity and cultural identity of the region. Topics covered include an historical geography of the region, including pre-columbian civilizations, Iberian, African, and European influences; the geography of transportation networks, agriculture, urbanization, and population. National boundaries, major landforms and climatic conditions are discussed to describe their effect on civilization. This course also investigates the historical relationship between the United States and Latin America and covers recent U.S. military interventions in the region.</p> |                                                                                       | No Course Offerings                                |

| <p>This course examines the cultural and natural diversity of African landscapes, with an emphasis on development, population issues, disease, and the origin, dispersal, spatial organization, and interaction of important cultural groups. Africa's physical landscapes will also be introduced as the palette upon which Africa's complex human mosaic has developed. Students will explore, from a geographic perspective, why Africa has seemingly been plagued with problems of economic development, health, and political instability.</p>                                                                                                                                          |                                                                                       | No Course Offerings                                |

| <p>This course examines the cultural and natural diversity of Southwest Asian landscapes. The realm's cultures and ethnicities are studied in a geographic context, with an emphasis on the origin, dispersal, spatial organization, and interaction of important cultural groups. Among issues examined are the distribution and strategic significance of critical mineral and energy resources, population and resource disparities, cultural conflict, and economic development. Students will learn how geographic issues impact the prospects for peace and stability in the region.</p>                                                                                               |                                                                                       | No Course Offerings                                |

| The course examines European cultural landscapes, focusing on the environmental and cultural diversity exhibited among the states of modern Europe. Nationalism and the territorial imperative, long recognized as major forces in Europe, are studied from a geographic perspective to include patterns and processes of both regional continuity and change. Emphasis is given to the rapidly developing urbanization and mutual interdependence among countries of Western Europe. West and East European agricultural/industrial resource bases and developmental strategies are compared and contrasted. Specific topics are tailored to current issues and include regional conflict, economic development and trade, and problems of energy and the environment. This course concludes with a study of contemporary European extraregional spatial relationships with other major world culture regions. |        | No Course Offerings |

| <p>This course examines the political, social, and cultural history of Russia as it emerged from the Mongol era up to the present day. It explores the development of the Tsarist political and social systems, the emergence of literary, artistic, and revolutionary movements, and the development of Russia's position in European politics from the time of Peter I through WWI. It also covers the rise of the Soviet Union, the leadership's attempts to implement communist ideology and responses to that attempt, Russia's relationship with various national and ethnic groups, and the emergence of the Soviet Union as a superpower. The course concludes with the collapse of the Soviet Union and the emergence of new states in the 1990s.</p> |                                   | No Course Offerings                                |

| <p>For Cadets attending foreign military academies or other academic institutions. Cadets will attend classroom instruction and produce a historical research paper to be presented upon return to USMA. Instruction may be in English or foreign language. This class serves as the equivalent to a foreign course covering modern historical developments of the area/region where the cadet is studying. This course covers broad historical processes and developments of the region over a long period of time. The course effectively encompasses a recognized historical era, for example "Modern", "Early Modern", or "Ancient".</p>                                                                                                                   |                                   | No Course Offerings                                |

| History of the United States addresses the social, political, economic, foreign relations, and sectional developments of the nation from its colonial roots through the 21st century. The course consists of two blocks of instruction, each followed by a major examination. This course will help cadets know themselves and begin to develop strategic competence. The course also develops methods of historical research and analysis, critical thinking, lucid writing, and effective participation in classroom discussion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                            | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| HI108X, Regional Studies in World History, is a detailed study of the development and critical events in the history of one of six regions, each with its own letter designation. As the stems are all a part of one course, cadets may not take multiple stems as electives. The focus on one region enables cadets to develop a deeper understanding of a different culture and unfamiliar ideas and concepts. The course also develops methods of historical research and analysis, critical thinking, lucid writing, and effective participation in classroom discussion. HI108L combines with HI105 or HI155 to form the plebe history sequence of the Core Academic Program. The Latin America stem (identifier L) challenges cadets to study how social, political, economic, technological, and military factors have influenced international and multicultural relations and how these relations have influenced the development of specific societies, polities, cultures, economies, technologies, military systems, and gender roles throughout Latin America.                   |                                                                                                            | No Course Offerings                                           |

| HI108X, Regional Studies in World History, is a detailed study of the development and critical events in the history of one of six regions, each with its own letter designation. As the stems are all a part of one course, cadets may not take multiple stems as electives. The focus on one region enables cadets to develop a deeper understanding of a different culture and unfamiliar ideas and concepts. The course also develops methods of historical research and analysis, critical thinking, lucid writing, and effective participation in classroom discussion. HI108R combines with HI105 or HI155 to form the plebe history sequence of the Core Academic Program. The Russia stem (identifier R) challenges cadets to study how social, political, economic, technological, and military factors have influenced international and multicultural relations and how these relations have influenced the development of specific societies, polities, cultures, economies, technologies, military systems, and gender roles throughout Russia, Central Asia, and the Caucasus. |                                                                                                            | 2026-1                                                        |

| HI108W will focus on trade, technology, politics, society, and the state. These themes will help cadets understand how states and societies innovate, why states go to war, how they marshal the resources to do so, and how these factors have changed over time. In doing so, this course will help cadets know themselves, know others, and begin to develop strategic competence. The course also develops methods of historical research and analysis, critical thinking, lucid writing, and effective participation in classroom discussion. |                                                                                                            | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course encompasses the same chronological period and thematic coverage as HI105, but it assumes some familiarity with American history and consequently places special emphasis on historical analysis and criticism. Moreover, students acquire a broader understanding of American history and the historian's methods.                                                                                                                                                                                                                     |                                                                                                            | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| HI158W will focus on trade, technology, politics, society, and the state. These themes will help cadets understand how states and societies innovate, why states go to war, how they marshal the resources to do so, and how these factors have changed over time. In doing so, this course will help cadets know themselves, know others, and begin to develop strategic competence. The course also develops methods of historical research and analysis, critical thinking, lucid writing, and effective participation in classroom discussion. |                                                                                                            | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This one-term elective course traces the evolution of the art of war to 1900. Emphasis is placed on the changing character of warfare as nations adjusted to social, political, ideological, economic, and technological developments. The historical method is used as a tool for understanding war as a complex, ambiguous, and unpredictable human phenomenon. Analysis focuses on causation, the interrelationship of events as warfare evolved over the ages, operational and logistical aspects of military history, and the role of society in warfare. |                                                                                                                                                                                                                                                                                                     | 2026-1                                     |

| This core course traces the evolution of the art of war to 1900. Emphasis is placed on the changing character of warfare as nations adjusted to social, political, ideological, economic, and technological developments. The historical method is used as a tool for understanding war as a complex, ambiguous, and unpredictable human phenomenon. Analysis focuses on causation, the interrelationship of events as warfare evolved over the ages, operational and logistical aspects of military history, and the role of society in warfare. |                                              | 2027-1 2027-2 2027-8<br>2027-9 2028-1 2028-2<br>2028-8 2028-9 2029-1<br>2029-2 |

| This core course traces the evolution of the art of war to 1900. Emphasis is placed on the changing character of warfare as nations adjusted to social, political, ideological, economic, and technological developments. The historical method is used as a tool for understanding war as a complex, ambiguous, and unpredictable human phenomenon. Analysis focuses on causation, the interrelationship of events as warfare evolved over the ages, operational and logistical aspects of military history, and the role of society in warfare. |                                                                                                                                                                                                                                                                                                     | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This one-term, upperclass core course traces the evolution of the art of war from 1900 to the wars of the present day. Emphasis is placed on the changing character of warfare as nations adjusted to social, political, ideological, economic, and technological developments. The historical method is used as a tool for understanding war as a complex, ambiguous, and unpredictable human phenomenon. Analysis focuses on causation, the interrelationship of events as warfare evolved over the ages, operational and logistical aspects of military history, and the role of society in warfare. |                                                                                                                                                                                                                                                                                                     | 2026-1 2026-2 2026-4<br>2026-8 2026-9 2027-1<br>2027-2 2027-4 2027-8<br>2027-9 2028-1 2028-2<br>2028-4 2028-8 2028-9<br>2029-1 2029-2 2029-4<br>2029-8 2029-9 |

This two term, upperclass core course traces the evolution of the art of war from the hundred years war through the Napoleonic era to the American civil war and the wars of the twentieth century. Emphasis is placed on the changing nature of warfare as nations adjust to social, political, economic and technological developments. Analysis focuses on causation, the interrelationship of events as warfare evolved over the ages, operational and logistical aspects of military history, and the role of society in warfare.

This course traces the history of China from its emergence as the dominant culture in East Asia in the 10th century to the present. It examines how the legacies of the Tang empire in China played out in the multi-state system that endured from 960 to the Mongol conquest, and then were reclaimed in the form of the Late Imperial state under the Ming and "foreign" Manchu rule. It considers the search for a "new China" under the Republic, which was established following the collapse of the Late Imperial state, and how that search fared during a time of competing warlords and the rise of nationalism. It shows why Mao came to represent a new utopian vision and how that vision tragically failed. Finally, the course explores how the search for "new China" and historical legitimacy continues today both on the mainland and in the continuation of the Republic in Taiwan.

This course examines the theory and practice of warfare in Europe during the Age of Revolutions, roughly considered to be 1750 to 1814. Political revolutions such as the American and French Revolutions, along with other revolutions such as the Agricultural and the Industrial, and the intellectual ferment spawned by the Age of Enlightenment, all resulted in significant changes in the conduct of warfare. This course will examine those events, with particular focus on their relevance to the art of warfare. Themes include changes in military organization, doctrine, technology, and the accompanying social, political, and economic factors that influenced the armies of the day. The course will also cover the wars and campaigns that took place during this timeframe, including the American and French Revolutions and the wars of Napoleon.

|---------------|--------|-------------------|

This course enables cadets to explore the social, political, economic, and military interactions in the formation of the Modern Middle East. The first block examines the decline of the Gunpowder Empires and the subsequent penetration of European colonialism into the Islamic world (India, North Africa, Egypt, and the Levant), with emphasis on the factors that led to military decline of the Turkic world and the relative economic and military advantages of the European powers. During this block, students will discuss the Middle East's modernizing and reform efforts that European colonialism helped to catalyze, to include democratization, constitutions, capitalism, and industrialization. The second block covers the events that follow the World Wars and subsequent decolonization of the Middle East against the backdrop of the Cold War. Cadets will closely examine the Arab-Israeli conflict, the rise of Arab Nationalism and the tension between military revolutionary dictatorship and attempts at constitutional monarchy and republics. The final phase will begin with the Iranian revolution of 1979 and the Soviet invasion of Afghanistan. It will consider the rise of political Islam as a revolutionary ideology and the post-Cold War challenges leading to current wars and insurrections.

|---------------|--------|-------------------|

This course concentrates on the on the 'age of exploration' and its impact on the Early Modern World, 1453-1715. It provides students interested in the history of Early Modern Europe, the Atlantic world, the history of Africa and colonial Latin America a general understanding of the ideologies and institutions that enabled Europe to colonize parts of Africa and the Americas during this important period in world history. Specific topics include: medieval precedents of early modern imperialism; theories of monarchy and empire; ideologies of conquest and colonization; the continuity of Native cultures and beliefs; the relevance of race and slavery in understanding European influence in Africa and the Americas; and the creation of an Atlantic economy.

**Scope:** 2026-1

**Offerings:**

This course is a survey of the German lands from the dawn of the modern era through contemporary times. The course will combine social, political, economic, and cultural history in examining crucial themes and developments related to the German-speaking regions. Cadets will consider German nation and state formation; social, demographic, and economic transformation; imperialism, war and ideological change; the transformation of male and female roles; and trends in high and popular culture. The course will include a significant segment on twentieth-century Germany and the role the German state played in determining the course of world history, whether as the Nazi state that unleashed the Holocaust or as the West German Cold War bulwark. German history has much to teach us, and has led to enormous debates about the nature of the modern era.

**Offerings:**

The course focuses on the major diplomatic developments in Europe from 1814 through the end of the Cold War in 1991. It traces the emergence of the European state system after the Treaty of Westphalia and the impact of the revolution in France on European diplomatic relations. It examines the diplomatic system established at the Congress of Vienna through the crises and conflicts of the mid-19th century. The course also examines the various factors that led to the First World War, the developments of the interwar period, the origins and conduct of the Second World War, and the origins of the Cold War. The final lessons will explore Europe's role in the Cold War, the rise of international organizations, trans-national diplomacy, the end of the Cold War, and recent modifications to Europe's role in world affairs.

**Offerings:**

This course explores the complex history of South Asia upon which the modern states of India, Pakistan, and Bangladesh are founded. The course examines cultural roots, religious developments, and traditions of power and authority in the multiplicity of states before the introduction of Islam. It goes on to consider the impact of later Muslim control much of South Asia. It covers British rule of South Asia and focuses particularly on the violent partition at independence in 1947 into India and Pakistan. It will examine the legacies of Gandhi, Jinnah as the founder of Pakistan, and Winston Churchill as a figure in British India policy. Lastly the course studies the development of states since independence, including the transition of East Pakistan into Bangladesh, with particular attention to ongoing struggles over religious and secular identities.

**Scope:** 2026-1

**Offerings:**

This course explores the interaction between warfare and political systems in East Asia. It begins with the transition from military monarchy to bureaucratic empire in the Warring States Period. It then maps the rise of nomadic confederations in the Inner Asian steppe and their strategic interaction with the Han state. It traces how the collapse of the Han state led to military turmoil in East Asia, the rise of hybrid states, a new cosmopolitan empire, and then a multi-state system. It considers how in Japan, the importation of the bureaucratic state led first to centralization and then to the rise of the samurai and a feudal structure. Next, the course examines the development of a new form of nomadic confederation under the Mongols, and how Mongol warfare led to a more centralized state in China, and turmoil and a federalist system in Japan. In the modern period, the course considers how the challenge of Western military force led to political turmoil and the rise of the Communists in China, but in Japan led to the building of the Imperial Army, noted for its competence and for its atrocities. The course concludes with reflection on how the experience of war in East Asia continues to affect the region's politics and political structures.

**Scope:** 2026-1

**Offerings:**

This course surveys the cultural, economic, political, and social evolution of Latin America from the era of independence to the present. The course begins with a brief examination of Pre-Colombian and colonial events and structures. Students will study the economic development of modern Latin America and its influence on social, political, and military change. Case studies of national histories, such as Mexico, Cuba, Brazil, Argentina, and other countries help to illuminate the broad themes that underlie modern Latin American history. The course will examine Latin American relations with the United States and other nations of the world.

| HI351-352 parallels HI301-302. However, in addition to accelerated study of HI301-302 material, the cadet will study selected periods in greater depth and breadth. This course offers the cadet a more profound understanding of men and women as warriors and of the evolution of the art of war than would otherwise be available. |                                                                                                                                                                                                                                                                                                     | 2026-2 2027-2 2028-2<br>2029-2                     |

| This course examines the history of warfare around the globe from the end of the Napoleonic Wars through the First World War and its aftermath. It connects the study of military strategy, tactics, and campaigns with the political, economic, social, and cultural contexts and dynamics that shaped military developments. It explores the impact of changing technology on the conduct of war, the development of nationalism and imperialism, "cabinet wars" between European nation-states, wars of national unification, and wars of empire. This course explores several themes particularly useful to any modern soldier, including the nature and intensity of national and imperial wars and the effect of changing technology on society and the conduct of war.                                                                                                                                                                                                   |                                          | 2027-2 2029-2                                     |

| This course examines the history of the Sea, Air, and Space Domains in the 20th Century through exploring how US military and political leaders conceived of their utility and how each influenced the conduct and outcome of armed conflict. The course proceeds chronologically beginning with the introduction of Mahanian thought in the US Navy in the 1890s, adding in the development of military aircraft in the 1910s, and first uses of space during the Second World War. It traces the evolving role of each domain through the World Wars, Korea, Vietnam, late Cold War and immediate post-Cold War conflicts. Cadets will study the interactions between the three domains and how they shaped the contemporary operating environment. Cadets will be able to understand and appreciate the context of the modern joint force and how each domain is inherently interconnected and needed to find tactical, operational, and strategic success in war and peace. |                                          | 2027-2 2028-2 2029-2                              |

| During the Cold War, American policies of containment and collective security collided with attempts at communist expansion, wars of national liberation that resulted in the end of European empires throughout much of Africa and Asia (a process often called "decolonization"), as well as postcolonial conflicts shaped by the Cold War superpower confrontation. Cadets will examine the strategic conditions and political considerations influencing the use of force and diplomacy during this period. They will gain an appreciation for the various actors' decisions and experiences, how the Cold War and decolonization influenced societies across the globe, and the legacies of these conflicts.                                                                                                                                                                                                                                                               |                                          | 2026-1                                            |

| This course examines the history of armed conflict during the Cold War and the influence of ideology and technology on war in the second half of the 20th century. The course proceeds chronologically beginning with an introduction to the ideologies and alliances of the US and USSR, looking at the rise of non-aligned states and competing ideologies in the developing world, and first battles of the Cold War. It traces how the goals and objectives of the superpowers collided with local interests resulting in unexpected results and frustration. Cadets will study how technology became both a constraining and enabling factor in war during the period. They will be able to understand and appreciate the context of how warfare evolved during this period and how the legacies of Cold War conflicts shape the contemporary operating environment.                                                                                                       |                                          | 2027-1 2028-1 2029-1                              |

This course examines the Interwar Years, 1919-1939, and the Second World War from a global perspective while using a thematic approach to compare the different experiences of each of the major belligerents. Whether covering the Versailles Treaty, the rise of Adolf Hitler, the US Army during the Great Depression, home fronts, or the Holocaust, the cadets in the course will examine the social, political, cultural, and economic factors that contributed to how belligerents waged war, and, in turn, how war affected each of these factors across the globe. The course covers how and why the belligerents planned and executed particular strategies and operations in the European, Pacific, and China-Burma-India theaters to achieve their coalition and national goals. Finally, this course examines the interrelationship of sea, air, and land forces, and the complexities of providing logistical support to joint and combined operations on an unprecedented scale.

**Lessons:** 30 @ 75 min (2.000 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** A 1500-word research paper.

| <p>The millennium between the "fall" of the Roman Empire and the Voyages of Discovery--the Middle Ages--has often been characterized as brutish and inferior. Yet, this tough, fascinating society offered immeasurable potential for growth and adaptation. The personages and events of the European medieval world spawned many of the ideas and institutions of modernity. Topics for study will include the barbarian invasions, Byzantine Empire, Carolingian Europe, feudalism, medieval technology, Christian Church, medieval warfare, Crusades, rise of universities, crises of the 14th century, growth of monarchical power, and economic and social change.</p> |        | 2027-2 2029-2     |

| <p>After tracing the legacy of the middle ages, this course concentrates on the development of the modern nation state in Europe, 1453-1648. Specific topics include the renaissance, humanism, the reformation, the age of religious wars, and the contrast between the growth of absolutist and constitutional governments. The latter portion of the course concentrates on the political, social, economic, diplomatic, and military trends that shaped modern Europe.</p> |        | No Course Offerings |

| <p>This course is an introduction to European history from 1789 to the present. The course considers how and why Europe -- a small, relatively poor, and politically fragmented place -- became the engine of globalization and an important civilization in its own right. Our approach is broadly cultural, using politics, economics, society, religion, and other arenas to understand the events and people of Modern Western Europe. Chief topics: French Revolution, liberalism and the industrial revolution, socialism and the rise of labor, modern colonialism, world wars, communism and capitalism, decolonization, Cold War, and the European Union.</p> |        | 2026-2 2026-8 2026-9<br>2027-8 2027-9 2028-2<br>2028-8 2028-9 2029-8<br>2029-9 |

**Lessons:** 30 @ 75 min (2.000 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** A 1500-word research paper.

| <p>This course examines the political, social, and cultural history of Russia as it emerged from the Mongol era up to the present day. It explores the development of the Tsarist political and social systems, the emergence of literary, artistic, and revolutionary movements, and the development of Russia's position in European politics from the time of Peter I through WWI. It also covers the rise of the Soviet Union, the leadership's attempts to implement communist ideology and responses to that attempt, Russia's relationship with various national and ethnic groups, and the emergence of the Soviet Union as a superpower. The course concludes with the collapse of the Soviet Union and the emergence of new states in the 1990s.</p> |        | 2026-8 2026-9 2027-1<br>2027-8 2027-9 2028-8<br>2028-9 2029-1 2029-8<br>2029-9 |

**Lessons:** 30 @ 75 min (2.000 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** A 1500-word research paper.

**HI368** **MOD CENTRAL & E. EUR,1896-1989** **3.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2026-1

**Offerings:**

Between 1896 and 1989, Central and Eastern Europe experienced two world wars, at least three major revolutions, and radical industrial and environmental dislocations. The region witnessed everything from the birth of its modern culture to the creation of new post-World War I nation-states, to the Holocaust, to massive forced population shifts, to the creation of the communist Eastern Bloc, to the popular overthrow of Communism in 1989. Radical regimes on the right and left brought incredible change, quashed hopes, and produced both progress and suffering of unprecedented proportion. This course will examine life in late-19th and 20th century Habsburg Europe and its successor states of Poland, Hungary, Czechoslovakia, and Yugoslavia. It will do so comparatively, highlighting themes of nation-creation, everyday life, social transition, war, revolution, and ethnic cleansing.

2026-1 2028-1

**Lessons:** 30 @ 75 min (2.000 Att/wk) **Labs:** 0 @ 0 min

**Special Requirements:** A 1500-word research paper.

**HI369** **AMERICAN FRONTIERS** **3.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2026-1

**Offerings:**

HI 369 enables cadets to explore the social, political, economic, and military interactions between many diverse cultures in North America during the period of European and U.S. expansion since 1500. The course does this by examining the history of Native America and the "American" West, which included much of colonial British North America, and much of the American South through the 1830s, along with Spanish, French, and other European frontiers in North America. The course integrates Native American, Latino, and economic history in the study of migration, cultural contact, and "international" relations on the frontiers of North America. The course also explores change and diversity in cultural perspectives by examining myths of the West from a range of ethnic and other viewpoints. The course is an elective in the American History stem of the history program, but can be taken for credit in the International stem as well.

2027-2 2029-2

**Lessons:** 30 @ 75 min (2.000 Att/wk) **Labs:** 0 @ 0 min

**Special Requirements:** None

**HI370** **ANCIENT & MEDIEVAL WARFARE** **3.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2026-1

**Offerings:**

This course focuses on warfare from the dawn of recorded history through the fourteenth century. Thus, it will provide cadets with opportunities to study the campaigns of Alexander, the military methods of the Romans, the military aspects of feudalism, the Scottish war of independence, and other topics which are not covered in the core military courses. Although the course includes in-depth analyses of certain battles and campaigns, it places more emphasis on "war and society" issues such as the relationship between military participation and social standing in human societies, the connections between armies and governments, and the impact of economic, technological and social change on military structures. Also, HI370 will shift some emphasis away from the operational level of war to the analysis of the strategic and tactical levels of war, and away from use of secondary sources to use of primary materials.

**Special Requirements:** Two critical analyses of at least 750 words each; compensatory time provided.

**HI372** **US FGN RELATIONS SINCE 1898** **3.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2026-1

**Offerings:**

This course examines American foreign relations from the nation's entry into the world arena as a major power in 1898 through both World Wars, and the Cold War, to its station in today's multipolar world. It is a study of the forces, events, personalities, and principles that have shaped America's role in the world and provided the framework for the development of current foreign policy.

| <b>Scope:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 2026-1                                    | <b>Offerings:</b>                                 |
| This course begins with a survey of pre-colonial Africa, including the evolution of early human cultures, the rise and fall of African civilization and states, the spread of Islam, and the contact between Africans and Europeans. It will then focus on the region south of the Sahara, describing the forces which led to the partitioning of the continent, the practices of European colonialism/imperialism, the emergence of independent African states, and political, economic, and social developments in contemporary Africa.                                                                                                                                                                                                                                                                                                                                                                       |                                           | No Course Offerings                               |

| This course begins with the emergence of distinct Chinese civilization and the rich legacies of early and dynastic China. It will then trace the history of the imperial period from the creation of the state, through the rise of different dynasties, barbarian invasion, and Mongol occupation, until the height of imperial power under the rule of the foreign Manchus. It will move to consider why China had such difficulty with its Western contacts in the 19th century and why China has experienced such turmoil in the 20th century. The course concludes by examining Mao's rise to power and the tragic events that followed. The emergence of Taiwan as a separate regional power is also discussed.                                                                                                                                                                                           |                                           | No Course Offerings                               |

| This course examines the history of warfare in Europe from the Renaissance through the campaigns of Frederick the Great. It combines the study of military campaigns with that of the political, economic, social, and cultural factors shaping military developments. It explores the so-called "Military Revolution" of the sixteenth and seventeenth centuries with particular emphasis on the relationships between military developments and state building, the rise of absolutism in France and the Wars of Louis XIV, and the rise of Prussia and the Wars of Frederick the Great. Study of the so-called "age of limited war" sets the stage for future study of the American Revolution and the Wars of the French Revolutions and Napoleon. This course contains several themes particularly useful to the modern soldier. Among them are the nature, intensity, and complexity of wars of religion. |                                           | 2027-2 2029-2                                     |

| This course examines the military, economic, political, and cultural expansion of empires throughout the world beginning in the fifteenth century. It then explores the doctrines, ideologies, and practices of imperialism and colonial rule before moving on to consider how colonized peoples resisted colonial rule and were eventually able to mount anticolonial revolutions that created independent nation-states. The course ends with the collapse of European empires during the period of the Cold War.                                                                                                                                                                                                                                                                                                                                                                                             |                                           | 2027-2 2029-2                                     |

| Taking a global history approach, this course examines how industrial technologies, economic developments, and new political ideologies gave rise to the modern nation-state from 1780 to the present. It then explores on a global scale how these developments challenged societies and cultures through increasingly integrated trade networks and imperial projects, and then how they contributed to the World Wars of the 20th century. Lastly, the course analyzes how these developments led to the rise of a truly global economic and political system that has wrought far-reaching social and cultural changes across the world. The course will consider developments in Asia, Africa, Latin America, Europe, and the United States.                                                                                                                                                               |                                           | 2028-1                                            |

This course surveys the political, economic, and social evolution of Latin America by tracing its history from Pre-Colombian times through the 20th century. Beginning with an exploration of the three races that blend to create a unique Latin American culture, the course surveys the wide scope of Latin American history that has created Latin America, as we know it today. Specific attention is paid to the period of Spanish and Portuguese conquest and colonization, Latin America's fight for independence, and the subsequent struggle to build sovereign, modernized nations in the 19th century. This course ends by looking at the social revolutions and guerrilla insurgencies of the 20th century, and Latin America's attempt to overcome its historical problems of political instability, economic underdevelopment, and social stratification.

**Lessons:** 40 @ 55 min (2.500 Att/wk)    **Labs:** 0 @ 0 min

The course examines unconventional warfare from a historical perspective, particularly conflicts involving opponents with a significant disparity in their conventional military capabilities. Through several case studies, the course explores why belligerents succeed or fail in unconventional warfare and how ideology, technology, and social, political, and economic factors help determine the outcome of wars between regular and irregular forces. Covering a broad period of history, selected case studies include wars of conquest or colonization, revolutionary wars, and peacekeeping or constabulary operations.

This course introduces cadets to a variety of issues affecting the nature and conduct of war in the geographic and cultural region bounded by Turco-Arabic languages. A special emphasis is to understand the utility of warfare in a specific social context, that of evolving Turco-Arabic methods of governance, military institutions, and military operations from the time of Muhammad to the Treaty of Karlowitz. Significant military issues in this geographically, demographically, ethnically, and culturally diverse region are explored to gain historical perspective into the various social, political, and religious legitimacies groups of people have exploited in the quest to dominate Islamicate civilizations from 600-1700 CE.

This course engages with the development of military theory as an intersection of military and intellectual history. As a military history course, it addresses the history of the practice of warfare. As an intellectual history course, it explores the relationship between ideas and human behavior. The fusion of these two approaches engages with influential theorists and practitioners (including Clausewitz, Corbett, Liddell Hart, Brodie, and others) to examine how the intellectual currents of their respective eras intersected with their ideas on the utility of armed force, and how subsequent eras reinterpreted theories and ideas to align with their own views of war.

| <p>This course analyses the emergence, development and present cultural expression of the major religions of the world, emphasizing their 19th and 20th century experience. It also examines the development of religion in the ancient world and in pre-literate and non-technical societies. Cadets study the world's religions as molded by and as molders of the social, political and economic forces unique to particular cultures. Special attention is paid to the role of each religion in the formulation and adaptation of public and foreign policy.</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)    <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> A 1500-word research paper.</p>                                                                                                                                                                                                                                                                                                                                                    |                                 | 2026-1 2026-8 2026-9<br>2027-2 2028-1 2029-1 |

| <p>The stories we tell about our past matter, often on a grand scale. Narratives of the past produced by historians, artists, politicians, institutions, and communities reveal much about individual and collective identities within the United States. Such narratives often help shape local, regional, and national politics, institutions, identities, and values for both good and ill. This course examines American historical memory and the myriad ways in which American remembrance and commemoration of the past has interacted with, reflected, and affected contemporary conditions, communities, institutions, and values more than they have accurately narrated, portrayed, and commemorated past events. Ultimately this course will examine in a broad sense the role of history in shaping national identity and nationalism within the United States, and the place of history within American society and culture.</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)    <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> None</p> |                                 | 2027-2 2029-2                                |

| Between 1919 and 1960 the United States demobilized after one war, experienced dramatic but uneven economic growth, suffered the Great Depression, fought a second world war, and emerged as the premier world power in the Cold War that followed. Amid massive economic and international change, the nation underwent significant social and political change, with the growth of activist government, conflict between business and labor, the emergence of a widely based middle class, and the contested growth of civil rights movements. This course explores how and why the United States changed between the end of the First World War and the election of John F. Kennedy, connecting domestic and international contexts and trajectories.                                                                                                 |                                                                                  | 2026-2 2028-2                                      |

| This course examines the social, political, and economic origins and consequences of the American Revolution through the adoption of the Constitution. It explores the development of an American identity and the meaning of the Revolution for all Americans, to include women, African Americans, and the poor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                  | 2026-2 2028-2                                      |

| This course focuses on the causes and consequences of the American Civil War. Cadets will analyze the road to war, the war itself, and Reconstruction to place the entire period in its broader historical context. The course covers the ante-bellum South and North, focusing on the peculiar effect of slavery on society. Cadets will examine the home fronts to see the populace's reaction to war as both the Union and the Confederacy engage in conflict. In approaching Reconstruction, students will focus on the political, economic, and racial policies that were implemented to rebuild the nation.                                                                                                                                                                                                                                        |                                                                                  | 2026-2 2028-2                                      |

| Between 1865 and 1919, the United States emerged from the Civil War and became a rising world power. Mass industrialization during the Gilded Age made it a powerhouse in the global economy but also raised myriad social and political issues that eventually transformed the United States during the Progressive Era. Consolidating control over its continental territory in the last quarter of the 19th century, the United States then expanded and intervened overseas in 1898 and beyond, eventually becoming embroiled in the cataclysm of the First World War in 1917-1918. Theodore Roosevelt's America: the Gilded Age, Progressive Era, and World War I analyzes these and related issues, with particular attention to connections between changes at home and abroad, and between changes in political, social, and economic dimensions |                                                                                  | 2026-1 2028-1 2029-8                               |

| In 1960 the United States was deeply engaged in the Cold War with communism and the Soviet Union. Since then, the nation has experienced massive social, political, economic, cultural, and international change, with the growth of activist government and backlash against it, conflict between business and labor, economic stagnation and the return of a boom-and-bust economy, the contested growth of civil rights and other reform movements, the end of the Cold War and the return of ethnonationalism and great power competition. This course explores how and why the United States changed between the election of John F. Kennedy and the present, focusing on 1960-2001 and connecting domestic and international contexts and trajectories.                                                                                            |                                                                                  | 2027-1 2029-1                                      |

This course examines the history of civil rights and the Civil Rights Movement in America from 1865 to the present, focusing on the earliest efforts to achieve civil rights for African Americans and the constant evolution of those efforts. This course focuses on the political, economic, and social issues that shaped understandings about civil rights, citizenship, race, class and gender, enriching the understanding of the fight for Civil Rights in American History beyond the Civil Rights Movement of the 1950s and 1960s. While this course will focus primarily on African American civil rights and civil rights movements in American history, various other civil rights movements may be included for comparative analysis. Accordingly, this course will historicize issues related to race, ethnicity, and gender in ways that will better prepare future officers to lead in the modern Army.

History Staff Ride analyzes various campaigns and battles focusing on enhancing cadet understanding of the relationship between the strategic, operational and tactical levels of war and gaining a heightened appreciation for the importance of leadership on the battlefield. Cadets begin with classroom preparation and intense study prior to the staff ride, and through travel, experience the battlefields first-hand. They gain a historical understanding of the campaigns, and by walking the terrain, develop the ability to analyze complex battlefield problems and conditions. The ability to plan, prepare and execute a staff ride, with a focus on cadet led presentations and discussions, will also be evaluated. In addition, cadets participate in a number of cultural activities during travel.

This course is designed to teach cadets to analyze how humans have historically conceptualized themselves and others, and how they mobilized mutual associations and groups to claim political legitimacy and power. In particular, the course will provide historical comprehension of what these concepts are, theories of how, why, and when they emerged, and how they interconnect or break down. HI400 will examine modern developments such as the Enlightenment, the scientific revolution, the growth of the state, European-stimulated social movements and mass politics, and European imperialism to study why these changes inspired varied but overlapping methods for unifying peoples, creating boundaries, and defining differences. The course is global in content and multidisciplinary in method. \*\*This is a pilot course and must be reviewed by the Curriculum Committee NLT AY29-1 to continue.\*\*

| This course is taught by a senior member in the Department of History in a field of that historian's expertise. The course offers students the opportunity to study under the guidance of a historian in topics not normally offered by the Department of History. This course will include an exploration of the way in which history has been written; including examining the changing interpretations, traditions, methods, and frameworks of historians.                   |                                                                            | No Course Offerings                                |

| Innovations in technology, science, thought and ideology have radically changed the course of history across the world. This course examines why these innovations occur and then how they are practically applied in a military, social, political, economic, and cultural context. This course will include an exploration of the way in which history has been written; including examining the changing interpretations, traditions, methods, and frameworks of historians. |                                                                            | 2026-2                                             |

| This course is taught by the visiting Ewing Chair in Military History on a topic of that historian's expertise. The course offers students the opportunity to study under the guidance of a distinguished historian in topics not normally offered by the Department of History. The course may be taught by a distinguished visiting professor on the occasion that the Ewing Chair is unable to do so.                                                                        |                                                                            | 2026-2 2027-2 2028-2<br>2029-2                     |

| <p>This course explores the everyday experiences of people throughout history, focusing on how daily life has evolved across different cultures, societies, and time periods. From ancient civilizations to modern times, students will examine the routines, customs, and technologies that shaped the daily existence of ordinary people. Topics will include food, clothing, family structures, work, leisure, and social norms, as well as how major historical events, such as wars, revolutions, and industrialization, influenced the everyday lives of individuals. By engaging with primary sources, material culture, and scholarly interpretations, students will gain a deeper understanding of how people navigated their worlds, from ancient households to contemporary urban centers. This course emphasizes the significance of the "mundane" as a window into broader social, political, and cultural developments, highlighting how daily life reflects and contributes to the fabric of history. **This is a pilot course for AY26-1 and AY28-1 and must undergo review by the Curriculum Committee NLT AY29-2 to continue.**</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> None</p> |                                       | 2028-1                                            |

| <p>Although the Constitution outlined the form of federal government in the United States, it left unanswered many questions concerning how that government should function. This course examines how, between 1787 and 1826, evolving political thought, economic development, changing social conditions, and sectionalism influenced successive generations' debates about the role of government in American life.</p> <p><b>Lessons:</b> 30 @ 75 min (2.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> None</p> <p><b>Disqualifier(s):</b> HI390</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                       | 2027-1 2029-1                                     |

| <p>This course is an individually supervised research and study program. The cadet may engage in independent research or an internship and research either at West Point or another location, independent of a formal classroom setting. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty advisor. Activities vary by project, but the primary purpose is for the cadet to engage in independent study and produce a substantial work of scholarship. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member.</p> <p><b>Lessons:</b> 0 @ 0 min (0.000 Att/wk)      <b>Labs:</b> 0 @ 0 min</p> <p><b>Special Requirements:</b> Enrollment by permission of the Head of the Department. **HI498****COLLOQUIUM IN HISTORY****3.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)**Scope:**

2026-1

**Offerings:**

The colloquium employs seminar discussions of important books and scholarly articles to enhance understanding of major historical issues. Subcourses are designed to provide in-depth study of various topics in American, European, military, and international and strategic history. Cadets select a subcourse topic as the basis for their reading program after consultation with their faculty advisor or departmental counselor. Subcourse topics may vary each year in accordance with student interest and faculty expertise. The colloquium satisfies the 400-level course requirement for the history fields of study. Cadets who major in history should complete a colloquium that will support their subsequent enrollment in HI499, Senior Thesis in History.

2026-1

**Offerings:**

The course provides cadets selecting the major in history with an opportunity to enhance their skills in historical research and analysis. For this reason the course serves as excellent preparation for graduate study in history and related disciplines. Based upon their background and research interests cadets are organized into small thesis-writing seminars. Under the supervision of a seminar advisor, each cadet defines a topic, develops a research plan, accomplishes research, and drafts a thesis. The seminar meets occasionally to discuss issues in historiography and methodology, review progress in research, and critique draft papers. At the end of the semester cadets present their findings and defend their theses before a committee of faculty and fellow students.

| The course provides cadets selecting the major in history with an opportunity to enhance their skills in historical research and analysis. For this reason the course serves as excellent preparation for graduate study in history and related disciplines. Based upon their background and research interests cadets are organized into small thesis-writing seminars. Under the supervision of a seminar advisor, each cadet defines a topic, develops a research plan, accomplishes research, and drafts a thesis. The seminar meets occasionally to discuss issues in historiography and methodology, review progress in research, and critique draft papers. At the end of the semester cadets present their findings and defend their theses before a committee of faculty and fellow students.                                 |                                                                                                                               | No Course Offerings                                           |

| The greatest study of war, Carl von Clausewitz's On War, outlined a methodology for learning about war by study and reflection, integrating history and theory. WS301 introduces cadets to this methodology, providing the intellectual foundation they need for further coursework in the War Studies major. Cadets enrolled in this course will analyze both classic and recent works in Strategic Studies, along with historical case studies. Applying the theoretical content to examples of practice enables cadets to better understand both the theory and the history, and to test the value of generalizations, principles, or conceptual linkages proposed by theory.                                                                                                                                                       |                                                                                                                               | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This seminar examines the fundamentals of grand strategy in theory and in practice. It addresses the historical moment in which the modern concept of grand strategy was born and explores the major debates that have animated scholars and practitioners since. We focus on the core building blocks of grand strategy: the elements of national power that are available to be coordinated and applied in a coherent fashion across policy contexts. We analyze historical case studies to explore how the modern concept of grand strategy can be retrospectively applied to explain state behavior across time and diverse contexts. The seminar ultimately aims to prepare future Army officers to apply concepts from grand strategy to analyze and address complex problem sets in the contemporary international environment. |                                                                                                                               | 2027-1 2028-1 2029-1                                          |

WS335 Topics in Grand Strategy is the second of a two-part sequence designed to build on the course material covered in WS330. The course will cover applied regional and thematic topics in the study of grand strategy in a contemporary and/or historical context to illustrate key theoretical concepts. Grades are determined based on presentations, essays and other writing exercises, class participation, and a final exam, essay, and/or briefing.

|--------------|----------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

This interdisciplinary course examines the subject of military innovation from a theoretical, strategic, historical, and policy-oriented perspective. WS345 addresses several key questions: Why do militaries innovate? How does this process of innovation occur? Why do attempts at military innovation succeed or fail? To answer these questions, this course introduces the innovation concept and ties innovation to the levels of war. It provides the historical narrative to military innovation, while emphasizing the contemporary operating environment by exploring the possibility of a recent Revolution in Military Affairs through emerging technologies and the international security environment.

2029-2

|--------------|--------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

Leaders must possess the ability to communicate complex ideas clearly and concisely, both verbally and in writing. WS350 is grounded in the application of sound communication and narrative techniques relevant to the tactical, operational, and strategic levels of war. The course introduces the concept of information as an element of national power used to achieve U.S. strategic objectives. It then turns to how narratives are used to develop and execute strategy. Cadets gain foundational knowledge of how information is used to develop understanding, communicate, and act decisively. Students study interactions between the military and the media to understand influence campaigns and their effects during competition and conflict. The course culminates in crafting communication plans to tackle vital strategic challenges. Through a combination of theoretical understanding and practical application, cadets learn to develop strategic communication plans, engage with media effectively, and leverage information as a dynamic element of combat power.

|--------------|---------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

This course focuses on the evolution of generalship in the western military experience and the performance of general officers who have sought to translate success at different levels of war into achieving policy & strategic goals. The course examines how generals have crafted and executed military strategy from the early modern era to the present. It explores various factors that shaped strategic thinking and influenced the way generals commanded their forces in these different historical eras and analyzes the application of those ideas and systems in selected case studies.

**Scope:** 2026-1

**Offerings:**

This course explores the nature and dynamics of low-intensity conflict in contrast to conventional and high-intensity warfare. Specifically, cadets will examine the strategy and tactics of insurgency, counterinsurgency, international terrorism, and peace operations. Another component of this course examines Special Operations Forces (SOF) by exploring the unique methods of special operators and their relationship with irregular warfare. Cadets will examine how U.S. SOF are organized, how special operations in general succeed, and why SOF are well-suited for low-intensity conflict. Several relevant guest speakers are integrated into the instruction throughout the course.

This course introduces cadets to foundational concepts within US national security policy, strategic theory, and military strategy. Cadets analyze the decisions of US policymakers through practical case studies and contemporary events by applying major theoretical concepts in defense strategy and policy through individual critical thinking, group collaboration, and oral and written communication. Cadets will be able to understand, analyze, and effectively communicate the relation of tactical action to national policy within the context of the US defense establishment. \*This course will be conducted as a pilot course in AY26-2 and AY27-2. If there are substantive changes to the course, it will need review by the Curriculum Committee NLT AY28-1 to continue in AY28-2.\*

This course engages with the development of military theory as an intersection of military and intellectual history. As a military history course, it addresses the history of the practice of warfare. As an intellectual history course, it explores the relationship between ideas and human behavior. The fusion of these two approaches engages with influential theorists and practitioners (including Clausewitz, Corbett, Liddell Hart, Brodie, and others) to examine how the intellectual currents of their respective eras intersected with their ideas on the utility of armed force, and how subsequent eras reinterpreted theories and ideas to align with their own views of war.

Why do wars begin? How are they fought? Why and how do they end? Since the first and only use of atomic weapons in 1945, scholars and practitioners alike have argued for decades that the character of war is changing and that the pace of change is steadily increasing. That change can be disorienting, but there are many aspects about war's nature that are enduring and should be recognized as points of continuity even as war today continues to evolve. This course examines armed conflict in recent decades, analyzing trends in technological, sociological, political, and cultural change to better understand the modern character of war: its causes, conduct, and consequences. Cadets taking this course will be better prepared to understand change and continuity in modern warfare as they enter the profession of arms.

**Scope:** 2026-1

**Offerings:**

While the violent, interactive, and fundamentally political nature of war remains unchanged, the character of war has evolved over time and the pace of change appears to be accelerating. Among various other responsibilities related to studying and directing war, military professionals prepare the institution for future challenges by analyzing current and emerging trends to discern how the character of war is changing and will continue to change. This course introduces cadets to the study of future war through rigorous analysis of various theories of future war, current and emerging trends in the international environment and the defense and security communities, and emerging technologies. \*\*This course will be taught as a pilot in AY26-1 and AY27-1. It must be reviewed by the Curriculum Committee NLT AY27-2 to continue.\*\*

|--------------|----------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

The Academic Individual Advanced Development (AIAD) program is designed to give cadets practical experience in their field of study and to reflect on their experiences by completing specified requirements. Current AIADs that cadets may potentially execute for credit include domestic and international staff rides and internships to areas of strategic relevance, though AIAD availability will vary by year. Instructors, students, and host agencies will develop a specific academic plan prior to executing the AIAD that will require either department or curriculum review depending on the nature of the trip. Students will normally complete specially assigned readings, a daily reflective journal based on their practical experiences and write a term paper that benefits the host organization or expands on the AIAD's purpose. The assigned instructor will provide feedback on student submissions and assign term grades accordingly.

|--------------|-----------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

This course's objective is to analyze the defense policies of various countries and the outcomes of those defense policies, to include national security objectives, national military objectives, military doctrine, force structure, and military capabilities. Countries studied will include actual and potential coalition partners and potential adversaries. Cadets will examine the political, economic, and social influences on each military establishment. Cultural influences on the development and implementation of the defense policies for countries studied will be examined, including the effects each country's culture has on the missions, structure, roles, and capabilities of the military. Cadets will develop their own framework of analysis to critically analyze the defense policies and cultures of other countries, and will be able to clearly articulate that analysis through written and oral means. Guest speakers include liaison officers and Foreign Area Officers to provide insight into the specific military establishments of those countries studied.

| This course introduces cadets to the interdisciplinary nature of decision-making by addressing how leaders make decisions in situations of incomplete, conflicting, and incorrect information using forecasting, modeling, and gaming. The curriculum enables cadets to synthesize long-term developments and potential future scenarios through forecasting and trend analysis. It requires cadets to apply lessons in a series of complex, competitive games. Cadets will leave the class with a basic understanding of the complexities involved in strategic decision-making and methods to frame, understand, and address that complexity.                                                                                                                                                                                                                                                                                                  |                               | 2028-2 2029-2                              |

| This course provides a historical, theoretical, and practical understanding of the roles of sea, air, space, and cyber power, alliances, and coalitions in military strategy and national security policy. After establishing a strong theoretical and historical foundation in alliance warfare and conflict and competition within each of the domains, students apply their knowledge to assess the strategies of multiple state and non-state actors, and to make practical recommendations on the application of military power in a joint and multinational context during competition, crisis, and conflict.                                                                                                                                                                                                                                                                                                                              |                               | 2028-1 2029-1                              |

| The course provides an environment that is conducive to independent effort in a subject area of special interest to the cadet. Original research or specialized study can be accomplished in any of the many fields within War Studies. The course is conducted in three phases. First, the cadet and the individual advisor from the War Studies faculty will reach agreement on a subject area for research. Research methods will be studied under the direction of the faculty member. Research may involve field trips and personal interviews with experts in the area of study. In the second phase, the cadet will engage in independent research and prepare a draft analytical paper or report detailing the findings. During this period, frequent consultation with the faculty advisor occurs regarding the progress in the project. In the third phase, the cadet will present and define the findings before a faculty committee. |                               | 2028-1 2029-1                              |

| The Special Topics Course provides cadets an opportunity for reading and analysis in depth within a topic area of special interest and timely relevance to War Studies. The course director will determine the approach dependent on the topic and enrollment. Courses will normally develop the cadet's understanding of the topic through study of theory, history, doctrine, and historical and contemporary case studies. A generous portion of the course will normally address modern complex problems related to the topic area and assignments will emphasize analytical writing. Topics will vary by semester.                                                                                                                                                                                                                                                                                                                          |                               | 2028-1 2029-1                              |

| <p>This is a research methods course designed to support the interdisciplinary nature of the research-based courses in the War Studies Program, WS496 Thesis in War Studies and WS497 Client-Based Capstone in War Studies. In this course, students will learn different research methodologies for the strategic studies field and develop effective writing skills in a seminar format. Partway through the semester students will choose an interdisciplinary research topic related to the War Studies field. The topic, approved by the Course Director, will either be as part of a student-selected thesis for WS496 or an assigned client-based project for WS497. Thesis students must also select faculty members from across the institution to serve as their thesis advisors as part of WS495. Student assignments include practical exercises, a research proposal, a literature review and a draft research methodology.</p>                                                                                                                                                                                                                                                                                                                               |                                           | 2028-1 2029-1                                      |

| <p>Thesis in War Studies is an integrative course in strategy designed to provide War Studies majors with practical experience in addressing real, complex and ambiguous strategic issues. Students will write and defend an interdisciplinary thesis that in some way relates to the military instrument of power or national security. Thesis cadets will continue the work they began with their faculty advisors in the fall by revising their literature review and research methodology, then complete data collection, data analysis, thesis writing and ultimately conduct an oral defense of their thesis before an interdisciplinary faculty board.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                           | 2028-2 2029-2                                      |

| <p>Client-Based Capstone in War Studies is an integrative course in strategy designed to provide War Studies majors with practical experience in addressing real, complex and ambiguous strategic issues. Students will work in small groups to solve such a problem for an external client organization focusing on the use of the military instrument of power or national security strategy. Student groups will determine stakeholder needs, define the client's problem, and conduct appropriate research to develop a viable solution or set of recommendations. Groups will meet regularly with their client, complete a final written report and provide a formal presentation with an oral defense to the faculty. Alternatively, select students may work with an interdisciplinary team from another academic department's capstone course to contribute analysis from the strategic studies perspective to the group's project. Capstone cadets will continue the work they began with their faculty advisors in the fall by revising their literature review and research methodology, then complete data collection, data analysis, final report writing and ultimately conduct an oral defense of their work before an interdisciplinary faculty board.</p> |                                           | 2028-2 2029-2                                      |

| <p>This is a multi-disciplinary course administered through the Center for Holocaust and Genocide Studies. The Holocaust and its aftermath make enormous demands on us not just emotionally, but intellectually, requiring that we consider it from historical, military, psychological, philosophical, political, scientific, representational and legal perspectives. XH405 is a multi-disciplinary response to these challenges. The course will explore the causes, course, and consequences of the Holocaust, examining the processes that led to the Nazi genocide against the Jews, with a particular focus on the role of the military. It will examine the Holocaust from a variety of perspectives (perpetrators, victims, bystanders, resisters and rescuers), and consider the moral and ethical choices made by members of each group. The course will require an in-depth understanding of German and European history, and it will impart an appreciation for the cultures and mentalities of the interwar and wartime era. The course will utilize primary sources, films, documentaries,</p>                                                                                                                                                              |                                           | 2026-2 2027-2 2028-2 2029-2                        |

testimonies, and propaganda. It will conclude with consideration of the political and legal responses to the Holocaust in the later 1940s, and the later incorporation of the Holocaust into the global public consciousness.

**Lessons:** 40 @ 55 min (2.500 Att/wk)    **Labs:** 0 @ 0 min

2029-2

This is a multi-disciplinary course administered through the Center for Holocaust and Genocide Studies. It is a multi-disciplinary attempt to understand the dynamics which produce mass atrocity. Cadets will learn of the causes, course, and consequences of selected genocides, examining the processes that led to genocide, with a particular focus on the roles played by militaries. The course opens with the intellectual theories about the phenomena of ethnic cleansing and genocide. It will then move to the analysis of how ethnic cleansing and genocide are tied to conflict and militaries. Drawing from a variety of scholarly disciplines and methodologies, cadets will investigate the moral, legal, historical, and diplomatic problems these terms pose. For the remainder of the course, cadets will examine more directly the case studies of specific incidences of ethnic cleansing and genocide. These case studies will vary year-to-year, but they will include at least two examples of ethnic cleansing or genocide on the American frontier, in German Southwest Africa, the Ottoman Empire, the Soviet Union, Rwanda, Cambodia, Yugoslavia, China and in Europe. Cadets will study primary sources, films, documentaries, testimonies, and propaganda. All iterations of the course will consider the development of Western mass politics and the emergence of racial nationalism and new imperialism in late 19th century Europe.

**Scope:** 2026-1

**Offerings:**

2026-8 2026-9 2027-8  
2027-9 2028-8 2028-9  
2029-8 2029-9

For Cadets attending foreign military academies or other academic institutions. Cadets will attend classroom instruction and produce a historical research paper to be presented upon return to USMA. Instruction may be in English or foreign language. This class serves as the equivalent to a foreign course covering modern historical developments of the area/region where the cadet is studying. This course covers broad historical processes and developments of the region over a long period of time. The course effectively encompasses a recognized historical era, for example "Modern", "Early Modern", or "Ancient".

**Lessons:** 40 @ 55 min (2.500 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** None

| A knowledge of basic and applied anatomy is essential to the study of human beings engaged in motor performance. An individual who understands the anatomical bases that underlie human movement and who can systematically analyze movement and determine interventions is more likely to improve technique and reduce the risk of injury. Therefore, this course is designed to introduce the structures of human anatomy and explain how these structures are involved in human movement. In support of class room instruction cadets will be introduced to basic laboratory techniques and collection, analysis and interpretation of data demonstrating anatomical and mechanical function of muscles, joints, and limbs. On successful completion of the course, cadets should be able to identify and understand the anatomical structures essential for human movement and apply their anatomical knowledge to human movement problems in athletic, educational, clinical, and/or work settings. |                                                                                                                               | 2026-2 2027-2 2028-2<br>2029-2                                |

| A knowledge of basic and applied biomechanics is essential to the study of human beings engaged in motor performance. An individual who understands the mechanical bases that underlie human movement and who can systematically analyze movement and determine interventions is more likely to improve technique and reduce the risk of injury. Specifically, this course will provide cadets with: 1) a basic knowledge of the biomechanical foundations of human movement; 2) the knowledge and skills necessary to complete a systematic analysis and evaluation of human motor performance; and, 3) the ability to determine and provide interventions that are likely to improve movement.                                                                                                                                                                                                                                                                                                         |                                                                                                                               | 2026-1 2027-1 2028-1<br>2029-1                                |

| Performance Nutrition is designed to teach the basic concepts and functions of nutrition as well as their application to human performance. This includes emphasis in food chemistry, digestion, absorption, and utilization of nutrients, nutrient timing, and nutritive supplementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                               | 2026-2 2027-1 2027-2<br>2027-8 2028-1 2028-2<br>2028-8 2029-2 |

| This course comprehensively examines theory and research related to exercise psychology, and introduces sport psychology as an associated discipline. The course is designed to provide a broad overview of exercise psychology and increase understanding of how psychological factors influence adherence and performance in exercise and sport. Additionally, the course addresses associated topics including addictive and unhealthy behaviors, burnout and overtraining, aggression in sport, and character development through sport.                                                                                                                                             |                                           | 2026-1 2027-1 2028-1 2029-1                        |

| This course is designed to apply the principles of chemistry, physics, anatomy, and physiology towards an understanding of the impact of work on the human body. Study will include both mechanical and physiological response to acute bouts of work and functional adaptation to repeated bouts of work. In support of class room instruction students will be introduced to basic laboratory techniques and collection, analysis and interpretation of physiological data. In addition, material will be presented that will emphasize the influence of age, disease-states, or the environment on the physiological response as a clue to physiological mechanisms and significance. |                                           | 2026-1 2027-1 2028-1 2029-1 2029-2 2029-8 2029-9   |

| This course is designed to increase theoretical and practical knowledge and understanding of the administrative, medical, and biological aspects of developing physical competency through physical activity and exercise. Students will apply the scientific theories behind exercise assessment and prescription towards developing functional independence across the spectrum of activities for daily living, recreation, sports performance, and prevention and rehabilitation of disease covering various populations across the life span.                                                                                                                                        |                                           | 2026-1 2027-1 2028-1 2029-1                        |

| This course is designed to expose students to the physiology of muscular function and adaptation associated with a fundamentally sound resistance and conditioning program. The course will emphasize the description, assessment, and analysis of sport movement. It will facilitate student understanding of the design of progressive resistance training programs to enhance performance variables, bridging theory to practice. Basic anatomy will be reviewed, and muscle function and adaptation will be the focus, to include how muscle responds to training, detraining, and overtraining.                                                                                     |                                           | 2026-2 2027-2 2028-2 2029-2 2029-8 2029-9          |

| This integrative experience course was designed to provide cadets with advanced content knowledge in human adaptation to exercise and to serve as the USMA Integrative Experience. KN480 will address the overarching academic program goal: "to anticipate and respond effectively to the uncertainties of a changing technological, social, political, and economic world."                                                                                                                                                                                                                                                                                                            |                                           | 2026-2 2027-2 2028-2 2029-2                        |

| This course provides in-depth study of a special topic in exercise and sport sciences not offered elsewhere in the USMA curriculum. Course content will be based on the special expertise of the Visiting Professor, Rotating PhD, or a senior DPE faculty member.                                                                                                                                                                                                                                        |                                       | 2026-2 2027-2 2028-2 2029-2                             |

| This elective course provides an opportunity for a cadet to conduct an in-depth research project, study program, or special project in exercise and sport science. The cadet will formalize a proposal, develop a viable research plan, and conduct the project under the guidance and supervision of a faculty advisor. The Director - Human Performance Laboratory will approve all individual research projects. The course will require a commitment of approximately 40 hours.                       |                                       | 2026-1 2026-2 2027-1 2027-2 2028-1 2028-2 2029-1 2029-2 |

| This elective course provides an opportunity for a cadet to conduct an in-depth research project, study program, or special project in exercise and sport science. The cadet will formalize a proposal, develop a viable research plan, and conduct the project under the guidance and supervision of a faculty advisor. The Director - Human Performance Laboratory will approve all individual research projects. The course will require a commitment of approximately 80 hours.                       |                                       | 2026-1 2026-2 2027-1 2027-2 2028-1 2028-2 2029-1 2029-2 |

| This course provides Kinesiology majors with an opportunity to enhance their skills in clinical research and analysis. Under the supervision of a thesis advisor, cadets will implement the research proposal developed in KN493. Cadets will meet regularly as a group with their seminar advisors to discuss issues in design, methodology, and data analysis. At the end of the semester cadets will present their findings and defend their theses before a committee of faculty and fellow students. |                                       | 2026-2 2027-2 2028-2 2029-2                             |

| This course, which also qualifies as an Academic Individual Advanced Development (AIAD) opportunity, applies the law and history in an immersive, interdisciplinary study of civil rights in the United States and the resilience of foundational values over time. It consists of a week in the classroom and a two-week staff ride incorporating relevant historical locations into student learning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                      | 2026-7 2027-7 2028-7<br>2029-7                                                                                                 |

| This course provides an introduction to the study of jurisprudence and, thereby, an intellectual foundation for legal studies. Jurisprudence explores the theory and philosophy of law, its relations to morality, and its limits. The intent of the course is to provide cadets a platform on which to examine the nature of law, legal reasoning, and legal institutions. Topics covered include positivism and natural law theory, theories of criminal justice, concepts of liberty, responsibility, and human rights. Cadets also will learn the fundamentals of legal research and writing.                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                      | 2026-1 2027-1 2028-1<br>2029-1                                                                                                 |

| The Academic Individual Advanced Development (AIAD) program is designed to introduce cadets to the practice of law in the military. The course consists of a three-week internship in one of a variety of legal offices. Possible internships include clerkships with the Army Court of Criminal Appeals, the U.S. Court of Military Appeals, the U.S. Supreme Court, the Department of Defense, and the Department of the Army agencies. Cadets may also intern in Staff Judge Advocate or Trial Defense Offices at military installations worldwide.                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                      | No Course Offerings                                                                                                            |

| This course studies the United States Constitution and Military Law. Cadets will acquire information and skills in order to recognize and resolve constitutional and legal problems. The course provides analytical models for dealing with problems regarding societal and military order. Finally, the course seeks to enable the cadet to make an intelligent commitment to the values and preferences embodied in the Constitution and our system of military and civilian law. Examples from military law are used to model fundamental principles examined in the course. Significant court decisions are explored to support the course goals. Specific substantive areas include: separation of powers, judicial review, war powers, the law of armed conflict, equal protection, privacy, individual rights, searches and inspections, military justice processes, and military criminal law. |                                                                                                                                                                                                                      | 2026-1 2026-2 2026-5<br>2026-8 2027-1 2027-2<br>2027-5 2027-8 2028-1<br>2028-2 2028-5 2028-8<br>2029-1 2029-2 2029-5<br>2029-8 |

| <p>This course studies the United States Constitution and Military Law. Cadets will acquire information and skills in order to recognize and resolve constitutional and legal problems. The course provides analytical models for dealing with problems regarding societal and military order. Finally, the course seeks to enable the cadet to make an intelligent commitment to the values and preferences embodied in the Constitution and our system of military and civilian law. Examples from military law are used to model fundamental principles examined in the course. Significant court decisions are explored to support the course goals. Specific substantive areas include: separation of powers, judicial review, war powers, the law of armed conflict, equal protection, privacy, individual rights, searches and inspections, military justice processes, and military criminal law. This version of LW403 is designed specifically for Law majors who have had LW310 as a pre-req.</p> |                                    | 2026-1 2027-1 2028-1<br>2029-1                                                               |

| <p>This course uses a comparative approach to study the three major legal systems of the world: the English common law system, the civil law system (and its branches) of continental Europe, and the Islamic legal system. These three systems are the foundation for the laws and legal systems of most of the world today, including Latin America, Africa, the Middle East and east Asia. Similarities and differences between these systems and the American legal system are explored. Social, political, and economic factors which distinguish these systems and more recently have begun to integrate them are covered. Emphasis is placed on the sources of law, the procedures for resolving legal disputes, and basic principles of civil and criminal justice.</p>                                                                                                                                                                                                                              |                                    | 2027-1 2027-2 2028-1<br>2028-2 2029-1 2029-2                                                 |

| <p>Equal protection is an important aspect of the rule of law, and underlies the American approach to justice. This course uses case law to explore the struggle for civil rights in the United States by those discriminated against based on race, religion, national origin, sex, and sexual orientation. The course will focus on legal decisions that empowered change and the movement toward equality, as well as an understanding of the importance of diversity.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                    | 2026-2 2027-2 2028-2<br>2029-2                                                               |

| <p>Cyberspace has become an emerging area for legal regulation and military operations. This domain poses challenges and legal issues that impact criminal law, constitutional law, and international law. This course approaches cyber law from multiple perspectives including both international and domestic regulations. Specifically, the course will focus on international and customary law aspects of cyber operations along with U.S. law pertaining to cyberspace.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                    | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2027-8<br>2028-1 2028-2 2028-8<br>2029-1 2029-2 2029-8 |

| <p>This course will examine the legal, social, religious, cultural, and political motivations that justice systems use to characterize certain actions as "criminal." The course will revolve around the traditional reasons for criminal law, namely blameworthiness and punishment, and also examine how institutions use criminal law to serve their narrow interests. This course will introduce theories surrounding criminal law and illustrate how cadets may apply law immediately in their roles as officers. The course will examine federal and state criminal codes and also the Uniform Code of Military Justice. From a legal perspective based on the U.S. Constitution and other criminal codes, some of the topics covered include the death penalty, insanity, corporate crime, conspiracy, murder, necessity, and self-defense.</p>                                                                                 |                                                                                                                                                        | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2                                |

| <p>Environmental law has become an integral part of the legal system in the United States today. This course provides an introduction to environmental issues and the framework of the major federal environmental statutes (the National Environmental Policy Act, Clean Water Act, Clean Air Act, Endangered Species Act, etc.), and how the law works in practice. The course also covers environmental issues in the military and the growing subject of International Environmental Law. This course provides a solid understanding of the legislative, administrative and judicial system of environmental law today.</p>                                                                                                                                                                                                                                                                                                        |                                                                                                                                                        | 2026-1 2027-1 2028-1<br>2029-1                                                               |

| <p>This course is designed to develop in each student an understanding of basic law of armed conflict (LOAC), with an emphasis on issues that might arise on the battlefield at a tactical level. The ethical and historical background of LOAC will be examined, including Geneva Conventions and protocols, and how LOAC is enforced on international and national levels, to include prosecution under the Uniform Code of Military Justice. Illustrative examples will include the Nuremberg Tribunal, My Lai, and the Gulf War. The emphasis is on the LOAC responsibilities of the junior officer.</p>                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                        | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2027-8<br>2028-1 2028-2 2028-8<br>2029-1 2029-2 2029-8 |

| <p>This seminar course covers a broad range of traditional and contemporary constitutional law topics. In addition to studying U.S. Supreme Court cases in particular areas of constitutional law, cadets are given an opportunity to study the historical foundations of the U.S. Constitution and underlying theories and principles of constitutionalism. The seminar format demands active participation in classroom debate, role playing, and critical thinking about complex issues of law and policy. As part of the seminar curriculum, each cadet will assume the role of a Supreme Court Justice. In this role, the cadet will study a real case pending before the Supreme Court and will write an abbreviated opinion reflecting the cadet's decision based on principled reasoning. The seminar typically travels to the Supreme Court to hear argument in the studied case as part of the opinion writing exercise.</p> |                                                                                                                                                        | 2026-2 2027-1 2027-2<br>2028-1 2028-2 2029-1<br>2029-2                                       |

The modern battlefield has had a significant impact on the Law of Armed Conflict in a variety of ways. This course builds on the lessons from LW474 and explores complex issues in modern conflict like Human Rights, Drone Warfare, Civilians on the Battlefield, and War Crimes. The lessons in this course will challenge the cadets to think critically and creatively about the application of the law on the modern battlefield.

**Scope:** 2025-2

**Offerings:**

This course introduces future officers to the characteristics that mark American military justice as distinctive, useful, protective, and in some ways inherently problematic. In critically examining military law's practice and procedure, cadets will view military justice as an evolving system within a framework that combines Constitutional structure and requirements, civil-military relations among uniformed professionals, the civilian Commander-in-Chief, and Congress.

**Scope:** 2025-1

**Offerings:**

The field of international law is one of the most dynamic areas of the law, and its principles are often applied in addressing the complex security problems facing our nation. This course will familiarize cadets with the body of rules and expectations which govern the rights and obligations of states and international organizations, during both times of peace and conflict. In particular, this course will emphasize the aspects of international law that are relevant to the operational and tactical problems that officers will confront as they deploy overseas. This course will integrate some themes from other courses in the Department of Law and reinforce some fundamental principles officers will confront as they seek to understand the relationship between law, diplomacy, and military operations.

**Scope:** 2025-1

**Offerings:**

This seminar examines the legal framework for national security decisions. Cadets will analyze the delicate balance of liberty and security that must exist to preserve a democratic society. Particular areas include: constitutional separation of powers and shared responsibility for national security; the legality and scope of war and other uses of armed force short of war; access to and protection of sensitive information; intelligence collection and clandestine activities; the role of the media, responses to terrorism and international organized crime; and the formulation of national security policy and law.

**Scope:** 2025-1

**Offerings:**

This course introduces cadets to the basics of business and commercial law. Contractual principles under the common law and Uniform Commercial Code are emphasized. Current legal issues in the following areas are explored: consumer protection; real, personal, and intellectual property law; antitrust law; and employment discrimination. Included is a survey of the basic principles of government contracting law. Additionally, cadets engage in business negotiations exercises. This course employs both case study and problem-solving methods of instruction.

| The course guides the student to conduct intensive study in a legal subject area for which the cadet has a special interest. Each student enrolled in the course will work with a designated member of the Law faculty to develop and pursue a specific research topic. The course will be conducted in three phases, followed by a formal presentation. In the first phase, the student will work with the faculty advisor to develop a research topic, and plan a research strategy. Students in the second phase will conduct research under the guidance of the faculty member. In the third phase the student will document the research he or she has completed in a paper and refine the paper through a draft/review process with the faculty member. The final phase requires an oral presentation and defense of the research. |                                                                                                                                                           | 2026-1 2027-2 2028-2                                                                                   |

| This is the capstone course for both the American Legal Studies and International and Comparative Legal Studies Majors. The course is an advanced seminar in legal philosophy as applied to contemporary domestic and international legal issues. It analyzes these issues using the perspectives of jurisprudence (the ideas and reasoning of jurists) and legal theory (using insight from disciplines such as science, economics, and political theory to address legal problems). It explores theoretical and practical approaches to identifying, developing, and preserving the rule of law. The course integrates legal coursework throughout the Academy curriculum and the Cadet's respective legal studies major.                                                                                                              |                                                                                                                                                           | 2026-2 2027-2 2028-2<br>2029-2                                                                         |

| <p>The purpose of the Senior Thesis is to provide cadets with the opportunity to create a project that is academically, professionally, and personally meaningful to them and that reflects their thinking and abilities as developed at West Point and in the Department of Law. Through the scholarly project that results from this course, cadets will be expected to show how they and their work have progressed and that their work is of professional quality. Cadets will choose a faculty advisor with whom they will work over two semesters. In collaboration with the faculty advisor, cadets will explore their chosen areas of law with a goal of producing a project, usually a thirty page paper that is of professional quality. This paper will be completed during LW499. Cadets will meet individually with their advisors on a regular basis to discuss the law, progress on the thesis, and developmental issues.</p> |                                                                                                                                                                                                                      | 2026-1 2027-1 2028-1<br>2029-1                                                                                                 |

| <p>The cadet pursues research topics in Philosophy of his or her choice. The scope of the selected project is tailored to the interests of the cadet based on resources and in consultation with a faculty advisor. This cadet-created plan should equate to 40 hours' worth of research culminating in an appropriate term-end project worth 1CR, such as a poster presentation on Project's Day.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                      | 2029-1                                                                                                                         |

| <p>This course helps third-class Cadets develop their capacities to think clearly and critically and to write in a logically rigorous and conceptually precise manner. The course acquaints Cadets with various viewpoints on major philosophic issues, a significant part of it is devoted to developing Cadets' ethical reasoning ability. The study of ethical theory provides the foundation for this ability as well as the foundation for their Academy's character development efforts. The course also includes a substantial block on the ethical application of military power through the study of the Just War Tradition.</p>                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                      | 2026-1 2026-2 2026-5<br>2026-8 2027-1 2027-2<br>2027-5 2027-8 2028-1<br>2028-2 2028-5 2028-8<br>2029-1 2029-2 2029-5<br>2029-8 |

| This course is an advanced introduction to philosophy and ethics. It helps third-class Cadets develop their capacities to think clearly and critically and to write in a logically rigorous and conceptually precise manner. The course acquaints Cadets with various viewpoints on major philosophic issues, and a significant part of the course is devoted to developing Cadets' ethical reasoning ability. The study of ethical theory provides the foundation for this ability as well as the foundation for the Academy's character development efforts. The course also includes a substantial block on the ethical application of military power through the study of the Just War Tradition.                                           |                                       | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course provides cadets the methodological tools required to analyze and understand the important moments and topics in philosophy, developing the philosophical language necessary for success within the philosophy curriculum. Through the study of philosophy within the western tradition, cadets will learn about major developments in logic, metaphysics, epistemology, and ethics, among other areas. This background provides the foundational knowledge required of a philosophy major.                                                                                                                                                                                                                                          |                                       | 2026-1 2027-1 2028-1<br>2029-1                                |

| This course blends two areas of study that are often kept separate in university courses on logic: informal logic and formal (or symbolic) logic. Informal logic's emphasis is on natural language arguments relatively simple in structure, on rules of valid inference as codified in what is called traditional logic, and on the identification of mistakes in reasoning that make arguments logically weak though possibly persuasive (fallacies). Formal logic builds a symbolic representation of sentences and arguments, describes rigorous tests for determining whether symbolized arguments are valid, and provides the means to assess arguments of far greater complexity than the rules of traditional logic are able to manage. |                                       | 2026-2 2027-2 2028-2<br>2029-2                                |

This course will address the perennial questions concerning the nature of reality (metaphysics) and what we can know about it (epistemology). How do we acquire knowledge of the physical world, the nonphysical world? Are there noncorporeal entities (souls, deities, angels)? If so, what can we claim to know about them? How are belief and knowledge related? A systematic and comprehensive approach to these problems and others will entail reading works by Plato, Aristotle, Descartes, Locke, Leibniz, Hume, and Kant, as well as more recent metaphysicians and epistemologists.

| <p>This course offers a systematic examination and comparison of standard Ethical doctrines as well as an analysis of some of the fundamental concepts and assumptions belonging to the nature of ethical thinking itself (Meta-ethics). The ethical doctrines to be studied include those associated with renowned philosophers such as Aristotle (virtue theory), Kant (deontology), and Mill (utilitarianism). The focus will be not only on original texts which advance the doctrines but also on criticisms and defenses of them by contemporary philosophers. The texts of Meta-ethics to be studied belong to the analytic tradition of Philosophy and concern the meaning and status of normative language in general. PY320 provides a worthwhile background Cadets may apply in any course in applied Ethics, such as PY325 Military Ethics and PY326 Cyber Ethics. It will also prove useful to Cadets in other academic majors, particularly in Political Theory, Law, and History.</p> |        | 2027-2 2029-2     |

| <p>The fundamental values and principles of the warrior ethos can be traced back to ancient Greece and Rome. These values provide the moral boundaries of the military profession and distinguish members of this profession from other individuals and groups who employ violence to achieve their ends. Cadets in this course will examine the moral principles that define the profession of arms, both in terms of when the use of force is permissible (or even obligatory) to achieve political objectives, and what, if any, limits ought to govern how that force is used.</p> |        | 2026-1 2026-8 2026-9<br>2027-1 2027-8 2027-9<br>2028-1 2028-8 2028-9<br>2029-1 2029-2 2029-8<br>2029-9 |

| <p>This course explores the ethical, social, and legal issues arising from emerging technologies, with a focus on the internet, artificial intelligence, and robotics. Students will examine how these technologies shape society, influence personal and professional life, and challenge existing ethical frameworks. Topics include data privacy, cybersecurity, algorithmic bias, the ethics of AI decision-making, the impact of automation on jobs, and the potential consequences of autonomous systems in warfare and everyday life. The course will also address legal regulations and policy debates, encouraging students to critically evaluate the balance between innovation and the responsibility to safeguard human rights and societal well-being.</p> |        | 2026-1 2027-1 2027-8<br>2028-1 2028-8 2029-1 |

| This course provides cadets an opportunity for reading and analysis in depth of some of the seminal philosophical works in ethics. Taught in seminar format, the course challenges first-class and second-class cadets to take responsibility for discussion and analysis and for drawing connections between ideas as they occur throughout history and across cultures. The cadets will gain a deeper understanding of the human condition and of the complex world of values. |                                                                | 2026-2 2028-2                                     |

| This course provides cadets an opportunity for reading and analysis in depth of some of the seminal philosophical works in ethics. Taught in seminar format, the course challenges first-class and second-class cadets to take responsibility for discussion and analysis and for drawing connections between ideas as they occur throughout history and across cultures. The cadets will gain a deeper understanding of the human condition and of the complex world of values. |                                                                | No Course Offerings                               |

This course examines the nature of religion and its truth claims from the perspective of philosophical analysis. It examines such perennial questions as: is there a God? What are the arguments for and against the existence of a Supreme Being? How can a good God permit Evil? Is there life after death? Is it rational to believe in God or does faith stand above or against reason? What is the relationship of religion to ethics? Is the Good good because God commands it, or does God command the Good because it is good?

2026-1 2028-1

**Lessons:** 30 @ 75 min (2.000 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** A few essays of moderate length.

|--------------|------------------------------|----------------------------------------------------------|

---

**Scope:** 2025-2

**Offerings:**

Mathematics and the sciences (especially the natural sciences) have often been portrayed in the modern era as paradigmatic sources of knowledge. Nevertheless, one can still pose a number of lively and much-debated questions: what makes something a science? Is there a single "scientific method" or ideal way of discovering, confirming, or disconfirming scientific truths? Are there limitations to the knowledge the sciences can provide? Indeed, do the sciences provide knowledge? Does science make any presuppositions about the nature of the world or about what exists (ontology)? What is the nature of mathematics? Does it apply to a world of ideal objects, to rules for using symbols, or to the physical world? What kinds of things are numbers? Readings will include works by Peirce, Frege, the Vienna Circle, and Kuhn, as well as contemporary readings in the philosophy of science and mathematics and in the philosophies of physics, biology, the social sciences, and logic.

|--------------|---------------------------|----------------------------------------------------------|

---

**Scope:** 2025-2

**Offerings:**

This course will jointly address major topics in the traditional philosophy of mind and questions created by recent developments in artificial intelligence: what is mind? What is the relationship of a mind to the physical world, including the brain? What is consciousness and self-consciousness? What are the definitions of mental states and processes, such as perception, desire, belief, emotion, reasoning, and action, and their relationship? Can computers be constructed to think or behave like human beings, or to have consciousness? Readings will come from classical sources, such as Descartes, as well as contemporary literature in philosophy, cognitive science, and artificial intelligence.

**Scope:** 2025-1

**Offerings:**

The heritage from ancient Greece and Rome provides the foundation for the Western concept of the universe and the place of people in it. This course examines the origins of philosophy; the essentially secular view of man and the world established during the classical period; and major figures whose views continue to shape Western thought.

| This course focuses on philosophies originating in Asia, possibly including, but not necessarily limited to, those of India, China, Japan, and Korea. These philosophical traditions offer a valuable opportunity to broaden a student's intellectual perspective because they are largely free from the influence of the Hellenic philosophers that are so foundational to the Anglo-European canon. The course emphasizes engagement with primary source texts and attempts to locate those texts within the social, political, and historical contexts from which they emerged. The particular content of the course may vary in terms of the traditions explored and historical timeframe but will always do so in a way that respects the richness of the many distinct philosophies that have emerged from the Asian continent. |                                           |                                                    |

| This course examines a selection of texts written by central figures in the formative centuries of modern European philosophy. Their ideas have had continuing influence on philosophers down to our present day, as well as profound influence on the development of political thought and on the scientific understanding of human beings. Two schools of thought will be covered: Rationalism and Empiricism. Associated with the first school are the continental philosophers Descartes (widely accepted as the founder of Modern Philosophy), Spinoza and Leibniz. The school of Empiricism includes the British philosophers Hobbes, Locke, Berkeley and Hume.                                                                                                                                                                 |                                           |                                                    |

| This course gives primary attention to the systematic philosophy of the German thinker, Immanuel Kant, whose influence on Nineteenth Century thinking was widespread and who is commonly recognized as one of the pillars of Modern Philosophy. The course will also devote attention to other important areas of philosophical thinking in the Nineteenth Century, whether within the Kantian tradition or lying outside it in other movements, such as Utilitarianism or Pragmatism, which had a continuing and significant influence on later philosophical thinking.                                                                                                                                                                                                                                                              |                                           |                                                    |

| This course will introduce cadets to a representative sample major of figures and topics which have set the stage for understanding contemporary Philosophy in the so-called Analytic Tradition. Major figures include Frege, Russell, Wittgenstein, Moore, the philosophers of the Vienna Circle, and American philosophers such as Quine, Putnam, Davidson and Kripke. Topics include the ideal of a logically perfect language, meaning and reference, the nature of truth, the distinction between analytic and synthetic statements, the common sense analysis of metaphysical concepts, and the rule-centered social nature of language. As appropriate, leading figures and ideas drawn from Continental Philosophy will be introduced.                                                                                        |                                           |                                                    |

PY390 brings together a faculty member from DEP and one other department with Cadets majoring in those two departments with the aim of conducting a joint investigation of an important topic or cluster of topics, or the work of a single author, of recognized significance and shared interest. It will be taught every other year, on each occasion combining Philosophy with another discipline. Examples of second disciplines include History, Political Theory, Psychology, and Law. Examples of topics include: justice, philosophies of history, the evolution of human rights theory, the relationship between morality and law, cognition and mental phenomena, and evolving conceptions of citizenship. Examples of single author investigations include: Locke, Rousseau, Hume. The course will count as credit towards the major in both of the paired departments.

|--------------|-------------------------------------|----------------------------------------------------|

---

**Scope:** 2025-2 **Offerings:**

This course provides cadets with the opportunity for advanced study in the discipline. Through the advanced study of a topic in philosophy, cadets will build on the foundation established in PY300 and throughout their academic career at West Point. They will deepen their mastery of philosophical concepts and methods and grow as scholars by applying those concepts and methods to a number of different disciplinary perspectives. Through intensive study of primary and secondary texts, this course broadens the knowledge base by bridging disciplinary approaches and setting the stage for cadets' continued educational development. 2026-2 2027-2 2028-2 2029-2

**Lessons:** 16 @ 140 min (1.000 Att/wk) **Labs:** 0 @ 0 min

**Special Requirements:** A major project and a few essays of moderate length.

| <p>This course permits cadets to participate in a capstone project that requires application of philosophical research and thought to a real-world problem. It is intended to develop the participants' philosophical research, writing and logical argumentation skills and have them gain collaborative communication skills as they work with industry partners. It is normally paired with PY494X, making it a year-long effort, but it can also stand alone depending on the scope of the project. If done together with PY494X, the two credits together will count towards the honor track of the Philosophy Major in lieu of PY490/91. *This is a pilot course that must be reviewed by the Curriculum Committee NLT AY26-2 to continue.**</p> |                                      | 2026-1 2027-1                                      |

| <p>This optional elective offers the cadet an opportunity for in-depth study of an advanced topic in Philosophy under the mentorship of a senior faculty advisor. The scope and topic of the course are developed in consultation with the faculty advisor and appropriately build upon academic work already completed in the regular Philosophy electives. Since such a course is beyond normal teaching duties, an agreement to serve as a faculty advisor will be at the discretion of the faculty member. Enrollment is subject to Department approval.</p>                                                                                                                                                                                       |                                      | 2029-1 2029-2                                      |

| The focus of the course is a topic such importance that it deserves a multi-disciplinary examination. Previous iterations of the course carried out with Bard College, examined the nature and cultural traditions of a Just War, and the complex nature of human intolerance. The course has included faculty and Cadets from the departments of English and Philosophy, History, Law, and Social Sciences. Intended for cows and firsties, it counts for credit towards the major in their respective departments. The course is conducted as a seminar course meeting in two-hour blocks during which the Cadets have chief responsibility for the discussion. A parallel course at the other institution engages undergraduates and faculty representing a comparably wide range of disciplines. |                               | No Course Offerings                               |

| This course prepares cadets with background deficiencies in algebra and trigonometry for the core mathematics program. The course develops fundamental skills in algebra, trigonometry, and functions, through an introduction to mathematical modeling and problem solving. Since this course does not count toward graduation requirements; cadets enrolled in MA100 will forfeit an elective opportunity.                                                                                                                                                                                                                                                                                                                                                                                                            |                                                           | 2026-2 2027-2 2028-2<br>2029-2                                                 |

| This course presents fundamental concepts in data-driven decision-making, using mathematical models to solve real-world, interdisciplinary problems. Students gain experience transforming ill-defined and complex problems into appropriate mathematical models by identifying reasonable and necessary assumptions. The course emphasizes proper interpretation of findings and effective communication of technical concepts to general audiences. The course exercises a wide array of mathematical concepts while nurturing creativity and critical thinking. Specific topics may include data analytics, classification, optimization, matrices, vectors, and continuous/discrete functions. Students use technology to visualize problems, explore potential solutions, and perform time-consuming calculations. |                                                           | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1                         |

| MA104 introduces the core concepts of differential and integral calculus, including limits, derivatives, integrals, and their applications. Students develop the ability to analyze and model change in one variable, solve real-world optimization and accumulation problems, and interpret the results of mathematical models. The course emphasizes conceptual understanding, problem-solving, and communication of results, with applications that may be drawn from areas such as the natural sciences, social sciences, engineering, and real-world decision-making contexts.                                                                                                                                                                                                                                     |                                                           | 2026-1 2026-2 2027-1<br>2027-2 2027-9 2028-1<br>2028-2 2028-9 2029-1<br>2029-2 |

This is the first course of a two-semester advanced mathematics sequence for selected cadets who have validated single variable calculus and demonstrated strength in the mathematical sciences. It is designed to provide a foundation for the continued study of mathematics, sciences, and engineering. This course emphasizes the interaction between mathematics and the physical sciences through modeling with differential equations. Topics may include a study of first order differential equations, first order difference equations, second order linear equations, systems of first order linear and non-linear equations, numerical methods, and non-linear equations and stability. An understanding of course material is enhanced through the use of a computer algebra system.

|--------------|--------------------------|----------------------------------------------------------|

---

**Scope:** 2025-2

**Offerings:**

An alternative version of the second semester of the mathematics core curriculum. This course, intended for students who have had a full year of high school calculus, provides a short review of single-variable calculus before progressing into multi-variable differential and integral calculus. It will also cover vectors and geometry of Euclidean space, vector functions, and vector calculus. Throughout the course mathematical models motivate the study of topics such as optimization, accumulation, change in several variables, and other topics from the natural, social, and decision sciences. Students who successfully complete the course will receive validation credit for MA104 and equivalency credit for MA205.

| This is the final course in the mathematics core curriculum. The course develops each cadet's ability to structure their reasoning under conditions of uncertainty and presents fundamental probability and statistical concepts that support the USMA core curriculum. Coverage includes data analysis, probabilistic models, independence, simulation, random variables and their distributions, hypothesis testing, confidence intervals, and linear regression. The course also introduces engineering applications of probability and statistics techniques. Applied problems motivate concepts, and technology enhances understanding, problem solving, and communication. |                                                 | 2026-1 2026-2 2026-3<br>2026-5 2026-8 2026-9<br>2027-1 2027-2 2027-3<br>2027-5 2027-8 2027-9<br>2028-1 2028-2 2028-3<br>2028-5 2028-8 2028-9<br>2029-1 2029-2 2029-3<br>2029-5 2029-8 2029-9 |

| This is the second course of a two-semester advanced mathematics sequence for selected cadets who have validated single variable calculus and demonstrated strength in the mathematical sciences. It is designed to provide a foundation for the continued study of mathematics, sciences, and engineering. This course consists of an advanced coverage of topics in multivariable calculus. Topics may include a study of infinite sequences and series, vectors and the geometry of space, vector functions, partial derivatives, multiple integrals, and vector calculus. An understanding of course material is enhanced through the use of a computer algebra system.      |                                                 | 2026-2 2027-2 2028-2<br>2029-2                                                                                                                                                               |

This is the advanced version of the final course in the mathematics core curriculum. The course develops each cadet's ability to structure their reasoning under conditions of uncertainty and presents fundamental probability and statistical concepts that support the USMA core curriculum. Coverage includes data analysis, probabilistic models, independence, simulation, random variables and their distributions, hypothesis testing, confidence intervals, and linear regression. The course also introduces engineering applications of probability and statistics techniques. Applied problems motivate concepts, and technology enhances understanding, problem solving, and communication.

2027-1 2027-2 2028-1  
2028-2 2029-1

**Lessons:** 30 @ 75 min (2.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** None

**Prerequisite(s):** MA104  
-Or-  
MA255  
-Or-  
MA204

**Disqualifier(s):** MA206

## MA289 INTRO IND STUDY IN MATH (1CR)

**1.0 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2024-2

**Offerings:**

This course is an individually supervised research and study program. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty member. Activities vary by project, but the primary purpose is for the cadet to engage in independent study and produce a work of scholarship. With the approval of one of the Program Directors in the Department of Mathematical Sciences, the cadet chooses a project of interest and is supervised by a faculty member. Cadets are expected to perform a total of 40 hours of work for the semester. A final presentation and final project deliverable are required.

2026-1 2026-2 2027-1  
2027-2 2028-1 2028-2  
2029-1 2029-2

**Lessons:** 0 @ 0 min (0.000 Att/wk)      **Labs:** 0 @ 0 min

**Special Requirements:** Enrollment by permission of one of the Program Directors in the Department of Mathematical Sciences. Other requirements as determined by the Faculty Advisor. Discipline-specific final project is required.

| This course is an individually supervised research and study program. The scope of the course is tailored to the needs of the project and interests of the cadet in consultation with a faculty member. Activities vary by project, but the primary purpose is for the cadet to engage in independent study and produce a work of scholarship. With the approval of one of the Program Directors in the Department of Mathematical Sciences, the cadet chooses a project of interest and is supervised by a faculty member. Cadets are expected to perform a total of 40 hours of work for the semester. A final presentation and final project deliverable are required.                             |                                                                                                                                                                                                              | 2026-1 2029-2                                                        |

| This course introduces the mathematical theory of ordinary differential equations and its application to problems in science and engineering. The course emphasizes the conceptual and theoretical understanding of differential equations necessary for advanced study in mathematical sciences. The course covers first and second order differential equations, systems of differential equations, and infinite series. Students will utilize a range of fundamental solution techniques - analytical, qualitative, and numerical. Special focus will be placed on the theory of existence and uniqueness of solutions.                                                                            |                                                                                                                                                                                                              | 2026-1 2027-2 2028-2                                                 |

| This course provides additional mathematical techniques and deepens the understanding of concepts in mathematics to support continued study in science and engineering. Emphasis is placed upon using mathematics to gain insight into natural and man-made phenomena that give rise to problems in differential equations and infinite series representations of functions. Analytic and numerical solutions to differential equations and systems of differential equations are found using a variety of techniques. Linear algebra topics include solutions to homogeneous and non-homogeneous systems of equations. An introduction to classical partial differential equations is also included. |                                                                                                                                                                                                              | 2026-2 2026-8 2027-2<br>2027-9 2028-2 2028-9<br>2029-2 2029-8 2029-9 |

| This is a course designed for the advanced mathematics student that has completed courses in differential equations and vector calculus (those that have completed MA153 and MA255) and will study ME, EE, NE, Physics or Space Science. MA365 begins where the advanced mathematics program ends. The advanced engineering course offering includes topics in linear algebra, complex variables, Fourier series, partial differential equations, and computational mathematics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                           | 2026-1 2027-1 2028-1<br>2029-1 2029-8 2029-9                                                                         |

| MA367 is a required course for those majoring in economics and is available to any who would like to develop their understanding of the mathematical tools applied to common methods of inquiry in several of the social sciences including, but not limited to, psychology and political science. The course develops student ability to use and develop mathematical models to quantify the relationship between variables, actors, and outcomes. The course helps formalize and quantify the properties of these relationships. The course continues to develop math skills introduced in the core math program, and it introduces more advanced math topics that serve as fundamental skills required for modeling in upper level microeconomics, macroeconomics, and econometrics courses. Specific topics include multivariable optimization, including linear and nonlinear programming, differential equations, stochastic modeling, and an introduction to dynamic programming. This course is designed to demonstrate the relevance of mathematics to the modern practice of analysis in the social sciences and to help prepare future Army leaders to use sound logic and relevant evidence to make convincing arguments. |                                                           | 2026-2 2027-2 2028-2<br>2029-2                                                                                       |

| This course emphasizes both the computational and theoretical aspects of linear algebra one encounters in many subjects ranging from economics to engineering. The course covers solutions of linear systems of equations and the algebra of matrices. The foundational aspects of vector spaces and linear transformations to include linear dependence and independence, subspaces, bases and dimension, inner products, and orthonormalization are developed. This is rounded out with a detailed investigation of eigenvalues and eigenvectors as they relate to diagonalization, quadratic equations, and systems of differential equations. The Invertible Matrix Theorem is explored as the conceptual/theoretical thread of the course. A computer algebra system is used to explore concepts and compute solutions to problems. Applications of the course material are included in the form of special problems to illustrate its wide scope.                                                                                                                                                                                                                                                                               |                                                           | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2027-8<br>2027-9 2028-1 2028-2<br>2028-8 2028-9 2029-1<br>2029-2 2029-8 2029-9 |

| The purpose of this course is to introduce topics in Discrete Mathematics, providing a foundation for further study and application. The topics covered are useful to both the applied mathematician and the computer scientist. They include propositional logic, elements of set theory, combinatorics, relations, functions, partitions, methods of proof, induction and recursion, digraphs, trees, finite state machines, and algebraic systems. Specific applications to computer science are presented.                                                                                                                                              |                                                           | 2026-2 2026-8 2027-1<br>2027-2 2027-8 2028-1<br>2028-2 2028-8 2029-2<br>2029-8                                |

| This course builds on the foundations presented in the core probability and statistics course to provide a broad introduction to some of the most common models and techniques in applied statistics. The mathematical basis for each of the models and techniques is presented with particular emphasis on the development of the required test statistics and their distributions. Topics covered include hypothesis testing, analysis of variance, categorical data analysis, regression analysis, and nonparametric methods.                                                                                                                            |                                                           | 2026-1 2026-2 2027-1<br>2027-2 2027-8 2027-9<br>2028-1 2028-2 2028-8<br>2028-9 2029-1 2029-2<br>2029-8 2029-9 |

| This course provides an undergraduate presentation of nonlinear topics in mathematical programming that builds on multivariable Calculus II. The emphasis of this course is on developing a conceptual understanding of the fundamental topics introduced. These topics include general convexity, convex functions, derivative-based multivariable search techniques, minima and maxima of convex functions, gradients, hessian matrices, Lagrange Multipliers, Fritz-John and Kuhn-Tucker optimality conditions, and constrained and unconstrained optimization. Computer software is used to explore and expose various key ideas throughout the course. |                                                           | 2026-1 2026-8 2027-1<br>2028-1 2029-1 2029-8<br>2029-9                                                        |

| This course introduces the student to the methods and language of upper division mathematics. It presents formal set theory, and introduces the student to the methods of formulating and writing mathematical proofs. Finally, it provides the student a rigorous introduction to the theory of relations, functions, and infinite sets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                             | 2026-1 2026-8 2027-1<br>2027-8 2028-1 2028-8<br>2029-1 2029-8 2029-9                  |

| This course introduces topics in fractal geometry and chaotic dynamical systems, providing a foundation for applications and further study. The topics from fractal geometry include the military applications of image analysis and data storage. The chaotic dynamical systems studied in the course are one-, two-, and three-dimensional, nonlinear, discrete and continuous dynamical systems. Topics include the logistics equation, the Henon attractor, the Lorenz equations, bifurcation theory, Julia sets, and the Mandelbrot set. These topics have applications in many fields of science, and examples from biology, meteorology, engineering, and the social sciences are studied. The course integrates concepts introduced in the core mathematics courses.                                             |                                                                             | 2027-1 2029-1                                                                         |

| This course develops an understanding of the methods for solving mathematical problems using a digital computer. Algorithms leading to solution of mathematical problems will be examined for consistency, stability, and convergence. After a brief review of calculus theory, a study of error analysis and computer arithmetic will provide the framework for the study of the following topics: solutions of equations of one variable, solutions of linear and nonlinear systems of equations, the use of polynomials to approximate discrete data, curve fitting, numerical integration and differentiation, and the approximation of continuous functions. Special problems will incorporate computer graphics and the use of mathematical software libraries to produce numerical solutions of applied problems. |                                                                             | 2026-1 2026-8 2027-1<br>2027-8 2027-9 2028-1<br>2028-8 2028-9 2029-1<br>2029-8 2029-9 |

| A one semester course providing a rigorous introduction to the calculus of a single variable. The course is designed to introduce the student to the foundations of the calculus necessary for advanced undergraduate and graduate studies in applied mathematics and engineering. Course coverage includes a treatment of the structure of the real number system, sequences, continuous functions, and differentiation. |                        | 2026-2 2027-2 2028-2<br>2029-2 |

| This course builds on the statistical foundation of the core mathematics sequence by exploring the application of statistical concepts to sports analytics. Students develop skills and apply statistical techniques appropriate for baseball and other sports including: regression, forecasting, and stochastic processes. Guest lectures and a course trip section to discuss Sabermetrics at the baseball Hall of Fame in Cooperstown, NY are part of this course (when available). Software packages (Mathematica, Excel) are used as decision support tools to investigate application problems and augment understanding of course material. |                        | 2026-2 2027-2 2028-2<br>2029-2 |

| This course is intended for individually supervised research and study, in order to familiarize cadets with techniques used in advanced scientific study. The primary purpose is to prepare students for independent research in mathematics with the essential skills required. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. |                                                                                                                                                                                                                               | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is intended for individually supervised research and study, in order to familiarize cadets with techniques used in advanced scientific study. The primary purpose is to prepare students for independent research in mathematics with the essential skills required. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research. |                                                                                                                                                                                                                               | 2026-1 2029-1 2029-2                                          |

| This course is intended for individually supervised research and study, in order to familiarize cadets with techniques used in advanced scientific study. The primary purpose is to prepare students for independent research in mathematics with the essential skills required. With the approval of the Head of the Department, the cadet chooses a research project of interest and is supervised by a faculty member conducting the research.                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                       | 2029-2                                     |

| This course is designed to give cadets the opportunity to develop skills in model construction and model analysis while addressing interesting scenarios with practical applications from a wide variety of fields. The course addresses the complex process of translating real-world events into mathematical language, solving the resulting mathematical model (iterating as necessary), and interpreting the results in terms of real-world issues. Topics may include model development from data, optimization, dynamic models, and deterministic and stochastic model development. Interdisciplinary projects based on actual modeling scenarios are used to integrate the various topics into a coherent theme. |                                                                                                                                                                                                                                       | 2026-2 2027-2 2028-2<br>2029-2             |

| MA394 exposes cadets to the basic concepts of networks and gives them an opportunity to apply techniques learned in the course to real-world problems. Students will develop skills and problem-solving strategies for modeling complex networks associated with physical, informational, and social phenomena. Software packages are used as decision support tools to investigate application problems and augment understanding of the course material.                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                       | 2027-1 2028-1 2029-1<br>2029-8 2029-9      |

| The focus of this course is to find numerical solutions of differential equations that result when modeling physical phenomena. The numerical solution of both initial value problems and boundary-value problems that arise with ordinary differential equations are covered. Techniques for solving partial differential equations are introduced. Software packages (Mathematica, Maple, Matlab, etc.) have proved to be very useful tools for many numerical techniques and are used to augment an understanding of course material.                                                                                                                                                                                 |                                                                                                                                                                                                                                       | 2026-2                                     |

---

**Scope:** 2013-1

**Offerings:**

This course introduces the student to the techniques, algorithms, and structures used in graph theory and network flows in order to solve real world discrete optimization problems. Basic definitions relating to graphs and digraphs, together with a large number of examples and applications are provided. Cadets learn to implement new graph theory techniques in their area of study. Emphasis is on modeling, algorithms, and optimization.

| This course introduces the basic techniques and modes of combinatorial problem-solving important to the field of computer science and mathematical sciences such as operations research. Applications of combinatorics are also related to fields such as genetics, organic chemistry, electrical engineering and political science. Combinatorial enumeration and logical structure are stressed. Applications and examples provide the structure of progression through topics which include counting methods, generating functions, recurrence relations, and enumeration techniques.                                                                                                                               |                                                                        | 2026-8 2027-1 2029-8                                                           |

| We study the underlying algebra of computer science structures as well as sets, set functions, Boolean algebra, finite state machines, groups, and modular arithmetic. We introduce and study mathematical aspects of cryptology with an emphasis on cryptanalysis of encryption ciphers. We study early paper-and-pencil systems through current computer algorithms for encryption. We employ algebraic principles in both design and analysis of encryption systems, be it matrix, linear feedback shift register sequence, or linear congruential random number generator sequence efforts. Further, we investigate the mathematics of breaking machine ciphers and of designing modern public-key crypto systems. |                                                                        | 2026-2 2027-2 2028-2<br>2029-2                                                 |

| This is an introductory course in modern algebra for cadets who plan to do graduate work in mathematics or theoretical work in the physical sciences or engineering. The emphasis of the course is on group theory, considering such topics as cyclic and abelian groups, normal sub-groups and factor groups, series of groups, and solvable groups. Selected applications are interspersed with the material on group theory. The course concludes with an introduction to rings and fields. One special problem is provided to allow the student to do independent research in an area of the student's interest.                                                                                                   |                                                                        | 2027-1 2028-1 2029-2                                                           |

| This course builds on the foundation presented in the core probability and statistics course to provide a mathematical presentation of the important topics in mathematical statistics. The course begins with a review of probability concepts from the core course, adding additional topics such as transformations of random variables and moment generating functions. To provide the mathematical basis for much of statistical practice, certain limit theorems and sampling distributions are proven. The central focus of the course is distribution theory, to include the theory of estimation and the theory of hypothesis testing.                                                                        |                                                                        | 2026-2 2027-2 2027-8<br>2027-9 2028-2 2028-8<br>2028-9 2029-2 2029-8<br>2029-9 |

|---------------|--------|-------------------|

This course builds on the foundations presented in the core probability and statistics course and the applied statistics course to develop a broad base of Advanced Data Science to some of the most common techniques in the field. The mathematical basis for each method is presented with focus on both the statistical theory and application. Topics covered may include classification and regression trees, regularization methods, splines and localized regression, and model validation.

| <b>Scope:</b> | 2022-2 | <b>Offerings:</b> |
|---------------|--------|-------------------|

This course provides an introduction to statistical modeling beyond that gained in MA376. Students will learn statistical models for analyzing quantitative and qualitative data. Methods will generally be taught in the generalized linear model framework and may include binomial and multinomial regression models, models for count data and models for survival data. Students will also be exposed to techniques for handling problems that arise when analyzing real data: for example missing data, unstructured data and influential observations.

|---------------|--------|-------------------|

This course emphasizes the applications of optimal solutions to linear algebraic systems using the simplex method of linear programming. This includes an in-depth development of the simplex method, the theory of duality, an analysis of the dual problem, convex hull concepts, integer programming, sensitivity analysis and the revised simplex procedure. Additional computational techniques that are applicable to specific mathematical models such as the transportation problem, assignment problem and network problems are also studied. Problems illustrating applications are emphasized throughout the course. Use of existing computer software to solve problems is also emphasized.

**Lessons:** 40 @ 55 min (2.500 Att/wk)     **Labs:** 0 @ 0 min

|--------------|-------------------------------|----------------------------------------------------------|

---

**Scope:** 2020-1

**Offerings:**

The course is devoted to the solution of the classical partial differential equations of mathematical physics and most engineering fields. For example, these equations describe such diverse phenomena as the flow of heat in a metal plate, the gravitational field of the solar system, the vibration of a structural beam, and the energy levels of the hydrogen atom. The subject matter has application in many fields and should be of interest to mathematics, science, and engineering concentrators. Specific topics covered are the heat, wave, and potential equations, Fourier series, series solutions to ordinary differential equations, special functions, and boundary value problems.

|--------------|----------------------------------|----------------------------------------------------------|

---

**Scope:** 2013-2

**Offerings:**

This course presents a logical development of complex variable theory sufficient for the development and solution of a number of interesting and practical problems. Residue theory is developed and applied to problems in integration and in the solution of partial differential equations via transform techniques. Conformal mapping theory is used to solve partial differential equations for which the solution is a harmonic function satisfying prescribed boundary conditions. These classical Dirichlet-Neumann problems model phenomena arising in the study of electrostatic potential, equilibrium thermodynamics, incompressible fluids, elasticity, and other areas of continuum mechanics.

**Scope:** 2019-1

**Offerings:**

This course provides an undergraduate presentation of computational problem solving that builds on math and science classes from USMA. The emphasis of this course is on developing a conceptual understanding of the fundamental topics in algorithm development as well as developing an understanding of a high level programming language. MA486 exposes students to mathematical applications best understood through computational analysis. Contemporary topics of application may include linear algebra, numerical analysis, statistics, data analytics and visualization, simulation, optimization, and machine learning. Students will be exposed to topics in computer science including data structures, object oriented programming, debugging, complexity, as well as testing and verification. We will use a high level computer programming language such as R or Python to explore and expose various topics.

| This course is intended to serve as an integrative experience for cadets of all majors and FOSs. Cadets having completed the core math program will be given the opportunity to explore ethical issues including legitimate data use, algorithmic fairness, and further develop skills in model construction and analysis while addressing problems and scenarios with practical applications from science, social sciences, engineering, computer science and/or mathematics. Interdisciplinary projects based on actual modeling scenarios are used to explore ethical issues and integrate the various topics into a coherent theme.                                                                                                                                                                                                                                                                      |                                                                            | 2026-2 2027-2 2028-2 2029-2                        |

| The student integrates the mathematical concepts and techniques learned in previous courses with the principles developed throughout the whole USMA Curriculum to solve a current problem of interest to the individual, to the Academy, or to agencies in the Department of the Army. Cadets may select problems from a list of suitable projects provided by the Department of Mathematical Sciences. Cadets choose a faculty advisor who has an interest and background in the problem. Cadets may work individually or in small teams, depending on the nature of the research. Regular workshop sessions will be held. Cadets will be given an opportunity to present their research at the Service Academies Student Mathematics Conference and/or other undergraduate conferences. Research reports will be reviewed, edited, and compiled into the USMA Transactions on Cadet Mathematical Research. |                                                                            | 2026-1 2026-2 2027-2 2028-2 2029-2                 |

| This course is the logical extension and synthesis of MA484 and MA485. It employs the integral calculus of complex functions and the theory of residues to investigate solutions to a number of partial differential equations arising from electrostatics, thermostatics, elasticity, gravitation, and other fields of continuum mechanics. The Poisson-Integral Formula is applied to the solution of boundary-value problems. Fourier and Laplace transforms are studied in detail and are used to develop general techniques for the solution of many ordinary, partial, and integral equations which result from the above applications. |                                                           | No Course Offerings                                |

| Continuation of MA487. Topics include sequences and series of functions, equicontinuity power series, Fourier series, the exponential and logarithmic function, and the Gamma function. The last portion of the course will be devoted to individual research projects.                                                                                                                                                                                                                                                                                                                                                                       |                                                           | No Course Offerings                                |

| The course begins with cardinality and the modern definition of a function. Then the basic properties of topological spaces--compactness, connectedness, and continuity--will be emphasized. Special attention will be given to metric topologies on Euclidean spaces. Complete metric spaces and function spaces will be introduced.                                                                                                                                                                                                                                                                                                         |                                                           | 2027-1                                             |

| The purpose of the Senior Thesis is to provide cadets with an unique opportunity to create a scholarly product that is academically, professionally, and personally meaningful to them and that reflects their thinking and abilities as developed at West Point and in the Department of Mathematical Sciences. Cadets will choose a faculty advisor with whom they will collaborate over two semesters. Cadets will meet on a regular basis with their advisor to discuss mathematics, progress on their research and thesis, and developmental issues. The objectives of the research are: (1) to synthesize and cohere the cadet's studies; (2) to apply methodological skills of research design, conceptual reasoning, analysis, and research gained to a selected area of substantive interest; (3) to extend the cadet's in-depth study of the selected area of interest beyond the level obtained in the Mathematical Sciences Major; (4) to design and conduct focused research beyond the constrained opportunities in elective courses; and (5) to develop cadet skills in conceptual reasoning, critical analysis, and effective writing. |                                                                  | 2026-1 2027-1 2028-1<br>2029-1                     |

| This course continues the work on the thesis commenced in MA 498. At the end of the course, cadets will submit a written thesis to the Department of Mathematical Sciences. In addition, cadets will defend that thesis before a faculty committee. Cadets will be given an opportunity to present their research at the Service Academies Student Mathematics Conference and/or other undergraduate conferences. Theses will be reviewed, edited, and compiled into the USMA Transactions on Cadet Mathematical Research.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                  | 2026-2 2027-2 2028-2<br>2029-2                     |

| The cadet pursues advanced study of a topic in aerospace engineering on an individual or small group basis, independent of a formal classroom setting. Similar to graduate level research, the scope of the selected project is tailored to the interests of the cadet based on resources and in consultation with a faculty advisor. To develop research skills, the cadet is integral in all phases of project completion by defining objectives, studying fundamentals and background material, outlining the approach, conducting analysis, and communicating results. |                                                                                                                                                                                                                                              | 2026-1 2027-1 2028-1<br>2029-1                     |

| This course provides an overview of the field of Aerospace engineering and an introduction to engineering analysis through modeling, simulation, and experimentation. AE201 provides an introduction to structured programming for engineering applications and an overview of solid modeling using Computer Aided Design. *Pending ABET-PEV review of ET=3.5CR. The ET credit is proposed and will be validated through Academy processes.                                                                                                                                |                                                                                                                                                                                                                                              | 2026-2 2027-2 2028-2<br>2029-2                     |

| This introductory course provides an understanding of how fixed-wing aircraft work and the forces and airflow involved in flight. Equations of motion are derived for a rigid aircraft in steady state level flight, maneuvering flight, and during takeoff and landing. Theoretical concepts are demonstrated in laboratory sessions that include actual flights in the Department of Civil and Mechanical Engineering's fixed-wing aircraft, and the evolution of flight during a museum field trip.                                                                     |                                                                                                                                                                                                                                              | 2026-1 2027-1 2028-1<br>2029-1                     |

| The cadet pursues advanced study of a topic in aerospace engineering on an individual or small group basis, independent of a formal classroom setting. Similar to graduate level research, the scope of the selected project is tailored to the interests of the cadet based on resources and in consultation with a faculty advisor. To develop research skills, the cadet is integral in all phases of project completion by defining objectives, studying fundamentals and background material, outlining the approach, conducting analysis, and communicating results. |                                                                                                                                                                                                                                              | 2026-1 2027-1 2028-1<br>2029-1                     |

| This course applies the fundamentals of thermodynamics to the study of air-breathing (turbojets, turbofans, and turboprops/turboshafts) and non air-breathing (rocket) air vehicle propulsion systems. Propulsive forces and performance parameters for these propulsion systems will be explored. Propeller characteristics and performance of electric and hybrid-electric propulsion systems are introduced. ***This is a provisionally approved course for the Aerospace Engineering Major (AEN0) and must undergo review by the Curriculum Committee NLT AY27-1. Pending ABET-PEV review of ET=3.5CR.***                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                              | 2027-2 2028-2 2029-2                               |

| The course covers the introduction of mechanics of materials and introduction to linear elasticity, including stress and strain, generalized Hooke's law, thin-walled pressure vessels, and principal stresses. The course also covers the form and function of aerospace structural components, materials allowable, and factors and margins of safety. Flight and ground loads and the bending of beams having asymmetric cross-sections are covered as they relate to aerospace structures. Shear flow analyses of stress in idealized semi monocoque cross-sections and the elastic buckling of columns and thin-wall structures are introduced. ***This is a provisionally approved course for the Aerospace Engineering Major (AEN0) and must undergo review by the Curriculum Committee NLT AY26-2. | The aerodynamics of vertical flight is analyzed for hover, translating, and partial power flight. Theory and experimental results are used to predict aircraft performance. The course analyzes the dynamic response of a rotor system and the performance aspects of the vehicle as a whole. This is followed by a design workshop, during which cadets complete the initial sizing of a vertical aircraft to meet specific mission requirements. The course includes one flight lab in a helicopter, a laboratory examining rotor power and thrust utilizing a whirl stand apparatus, and one field trip to a commercial helicopter company. ***This is a provisionally approved course for the Aerospace Engineering Major (AEN0) and must undergo review by the Curriculum Committee NLT AY26-2. Pending ABET-PEV review of ET=3.0CR.***       |                                                                                                                                                                                                                                              | 2027-2 2028-2 2029-2                               |

| <p>The cadet pursues advanced study of a topic in aerospace engineering on an individual or small group basis, independent of a formal classroom setting. Similar to graduate level research, the scope of the selected project is tailored to the interests of the cadet based on resources and in consultation with a faculty advisor. To develop research skills, the cadet is integral in all phases of project completion by defining objectives, studying fundamentals and background material, outlining the approach, conducting analysis, and communicating results.</p> <p><b>Lessons:</b> 20 @ 55 min (1.250 Att/wk)      <b>Labs:</b> 20 @ 55 min</p> <p><b>Special Requirements:</b> Enrollment by permission of Aerospace Engineering Program Director. Appropriate ET credit will be determined by the Aerospace Engineering Program Director on a case-by-case basis. Other requirements as determined by the Faculty Advisor.</p>                                                                                                                                                                          |                                | 2026-1 2027-1 2028-1 2029-1                       |

| <p>A course on the fundamentals of incompressible inviscid fluid mechanics and 2-D aerodynamics. Topics include fluid statics, flow kinematics, integral and differential forms of the governing equations, potential flow theory, and thin-airfoil theory. Applications emphasize aeronautics-relevant topics. This course provides knowledge of the fundamentals of fluid mechanics and aerodynamics. Fluid mechanics as applied to the theory of flight prepare students to understand external flows over aircraft including wing design, drag build-up, and viscous phenomena. The course concludes with an introduction to modern computational fluid dynamic tools. ***This is a provisionally approved course for the Aerospace Engineering Major (AEN0) and must undergo review by the Curriculum Committee NLT AY26-2. Pending ABET-PEV review of ET=3.0CR.***</p> <p><b>Lessons:</b> 28 @ 75 min (2.000 Att/wk)      <b>Labs:</b> 2 @ 120 min</p> <p><b>Special Requirements:</b> Two laboratory exercises involving a wind tunnel.</p> <p><b>Corequisite(s):</b> ME362</p> <p><b>Disqualifier(s):</b> ME481</p> |                                | 2027-2 2028-2 2029-2                              |

This course covers the fundamentals of aircraft and spacecraft design. Topics include understanding the mission and payload requirements, sizing methods, understanding design space, and tradeoffs. Students will be introduced to typical design and analysis tools used in the industry. \*\*\*This is a provisionally approved course for the Aerospace Engineering Major (AEN0) and must undergo review by the Curriculum Committee NLT AY27-1. Pending ABET-PEV review of ET=3.0CR.\*\*\*

**Lessons:** 40 @ 55 min (2.500 Att/wk)    **Labs:** 0 @ 0 min

**Special Requirements:** None

---

**Scope:** 2026-1

**Offerings:**

The cadet pursues advanced study of a topic in aerospace engineering on an individual or small group basis, independent of a formal classroom setting. Similar to graduate level research, the scope of the selected project is tailored to the interests of the cadet based on resources and in consultation with a faculty advisor. To develop research skills, the cadet is integral in all phases of project completion by defining objectives, studying fundamentals and background material, outlining the approach, conducting analysis, and communicating results.

2026-1 2027-1 2028-1  
2029-1

**Lessons:** 20 @ 55 min (1.250 Att/wk)    **Labs:** 20 @ 55 min

**Special Requirements:** Enrollment by permission of Aerospace Engineering Program Director. Appropriate ET credit will be determined by the Aerospace Engineering Program Director on a case-by-case basis. Other requirements as determined by the Faculty Advisor.

---

**Scope:** 2028-1

**Offerings:**

This course serves as the first half of the aerospace engineering capstone design experience. Cadets apply the aerospace system design process and their knowledge of math, science, and engineering mechanics to design solutions to real-world engineering problems. They must address public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors. Students begin capstone assignments early in the course and continue their projects with AE499. \*\*\*This is a provisionally approved course for the Aerospace Engineering Major (AEN0) and must undergo review by the Curriculum Committee NLT AY27-2. Pending ABET-PEV review of ET=3.5CR.\*\*\*

---

**Scope:** 2028-2

**Offerings:**

This course provides experience in the integration of math, science, and engineering principles into a comprehensive engineering design project. Open-ended, client-based design problems emphasize a multidisciplinary approach to total system design providing multiple paths to a number of feasible and acceptable solutions which meet the stated performance requirements. Design teams are required to develop product specifications, generate alternatives, make practical engineering approximations, perform appropriate analysis to support the technical feasibility of the design, and make decisions leading to an optimal system design. System integration, human factors engineering, computer-aided design, maintainability, and fabrication techniques are addressed. This course provides an integrative experience in support of the overarching academic program goal, and is often interdisciplinary in nature. \*\*\*This is a provisionally approved course for the Aerospace Engineering Major (AEN0) and must undergo review by the Curriculum Committee NLT AY28-1. Pending ABET-PEV review of ET=3.5CR.\*\*\*

2028-2 2029-2

|--------------|--------------------------------|----------------------------------------------------------|

---

**Scope:** 2026-1

**Offerings:**

Thermal-Fluid Systems I is an integrated study of fundamental topics in thermodynamics and fluid mechanics. The course introduces conservation principles for mass, energy, and linear momentum as well as the 2nd Law of Thermodynamics. Principles are applied to incompressible flow in pipes and turbomachinery, power generation systems, refrigeration cycles, and total air-conditioning focusing on the control volume approach. Laboratory exercises are integrated into classroom work. This course includes completion of a comprehensive, out-of-class design problem. This design problem provides the opportunity for students to apply engineering science and the engineering design process to a hands-on project. Lesson length varies between 75 minutes and 55 minutes (and corresponding preparation time varies as well).

**Lessons:** 38 @ 75 min (2.500 Att/wk)      **Labs:** 2 @ 75 min

| The cadet pursues study of a topic in mechanical engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the cadet based on resources and in consultation with a faculty advisor. To develop research skills, the cadet is integral in all phases of project completion by defining objectives, studying fundamentals and background material, outlining the approach, conducting analysis, and communicating results. |                                                                                                                                                                                                                                                | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| The cadet pursues study of a topic in mechanical engineering on an individual or small group basis, independent of a formal classroom setting. The scope of the selected project is tailored to the interests of the cadet based on resources and in consultation with a faculty advisor. To develop research skills, the cadet is integral in all phases of project completion by defining objectives, studying fundamentals and background material, outlining the approach, conducting analysis, and communicating results. |                                                                                                                                                                                                                                                | 2027-1 2028-1 2029-1                                          |

| This course introduces product design as an iterative decision making process. It also introduces project planning and team dynamics, technical communications, and using computing tools including structured programming and 2-D/3-D visualization and analysis to aid the design process. Cadets solve a series of progressively more challenging problems by applying the design process while addressing social, political, economic and technical issues. |                          | 2026-1 2027-1 2028-1 2029-1 |

| ME202 students explore computational methods of engineering practice. Students are introduced to: structured programming, instrumentation and data collection in experimental methods, numerical methods of engineering analysis, and simulation-based analysis. Considerable emphasis is placed on data analysis for understanding technical concepts. |                          | 2026-2 2027-2 2028-2 2029-2 |

2027-2 2028-1 2028-2  
2029-1 2029-2

**Lessons:** 14 @ 55 min (0.880 Att/wk)

**Labs:** 14 @ 55 min

**Special Requirements:**

Enrollment by permission of Mechanical Engineering Program Director. The program director will determine the applicable amount MA, BS and ET credit for each course offering, when required. Other requirements as determined by the Faculty Advisor.

**ME301**

**THERMODYNAMICS**

**3.5 Credit Hours**  
(BS=0.0,ET=3.5,MA=0.0)

**Scope:**

2026-1

**Offerings:**

Thermodynamics concerns the study of energy. In this course, the student will gain a basic engineering knowledge of energy applications and limitations. This course provides the groundwork for subsequent studies in engineering sciences and an appreciation of numerous problems associated with energy. Emphasis is placed on practical application to power generation, thermal and air pollution, refrigeration, air conditioning, automotive and aircraft engines, and combustion. Laboratory exercises are integrated into classroom work. This course includes completion of a comprehensive, out-of-class design problem. This design problem provides the opportunity to apply the principles of thermodynamics which are taught in the classroom to a realistic problem encountered by practicing engineers.

**DYNAMICS**

**3.0 Credit Hours**  
(BS=0.0,ET=3.0,MA=0.0)

**Scope:**

2026-1

**Offerings:**

Dynamics examines the motion of particles, systems of particles, and rigid bodies under the influence of forces. It focuses on the use of Newton's Second Law, in three major, progressive blocks of instruction: from scalar, then vector, treatments of rectilinear and curvilinear motion of single particles; through vector motion of systems of particles; to general three-dimensional motion of rigid bodies. The course also provides brief introductions to energy methods: work-energy and impulse-momentum.

**FLUID MECHANICS**

**3.5 Credit Hours**  
(BS=0.0,ET=3.5,MA=0.0)

**Scope:**

2026-1

**Offerings:**

Fluid Mechanics is the study of the behavior of liquids and gases under all conditions of rest and motion. The basic conservation laws are developed and applied to problems encountered in stream and pipe flow, modeling, low speed aerodynamics, forces on submerged surfaces, turbomachinery, and flow measurement. The course emphasizes physical concepts as well as mathematics and is augmented by laboratory work and a wide variety of training aids. This course provides the foundation for further study in aerodynamics, energy systems engineering, automotive engineering, civil engineering, and environmental engineering.

**Scope:** 2026-1

**Offerings:**

Course explores the relationship between the microscopic structure and macroscopic properties of materials used in engineering applications. The origin of mechanical and physical properties is studied. Emphasized is an understanding of the fundamental aspects of atomic and microstructural concepts for proper materials selection and enhancement of engineering properties. Materials under study are metals, ceramics, polymers, composites, nano-sized/structured materials, biomaterials, smart materials, and semi- and super-conductors. Laboratory exercises are incorporated throughout the course to provide practical experience in making decisions concerning material composition and processing in order to optimize engineering properties. Experiences from the field are detailed to demonstrate application of concepts.

**Scope:** 2026-1

**Offerings:**

This introductory course provides an understanding of how fixed-wing aircraft work and the forces and airflow involved in flight. Equations of motion are derived for a rigid aircraft in steady state level flight, maneuvering flight, and during takeoff and landing. Theoretical concepts are demonstrated in laboratory sessions that include actual flights in the Department of Civil and Mechanical Engineering's fixed-wing aircraft, and the evolution of flight during a museum field trip.

2027-1

|---------------|--------|-------------------|

The aerodynamics of helicopter flight is analyzed for hover, translating, and partial power flight. Theory and experimental results are used to predict aircraft performance. The course analyzes the dynamic response of the rotor system and the performance aspects of the vehicle as a whole. This is followed by a design workshop, during which cadets complete the initial sizing of a helicopter to meet specific mission requirements. The course includes one flight lab in a helicopter, a laboratory examining rotor power and thrust utilizing a whirl stand apparatus, and one field trip to a commercial helicopter company.

This seminar consists of a series of guest speakers. It will include all cadets majoring in mechanical engineering. Guest Speaker topics will address the concerns of professional mechanical engineers such as engineering ethics, continuing education, engineering economy, social and safety considerations, and professional registration. Guest lecturers will be primarily mechanical engineering practitioners, providing the students an opportunity to interact with professionals in their major field of interest.

| <p>This course introduces manufacturing machines and machine component design. Students develop their understanding of the engineering science behind static and fatigue failure theories and use it to design or choose mechanical components such as fasteners, springs, bearings, gears, and shafts. Instructors and laboratory technicians train cadets on safe use of machines such as mills, lathes, grinders, belt sanders, drill presses, bandsaws, and welding equipment. The course culminates in a team design and manufacturing project that uses the technical engineering and hands-on skills learned throughout the semester.</p>                                   |                                            | 2026-1 2026-2 2027-1<br>2028-1 2029-1                         |

| <p>This course serves as the first half of the mechanical engineering capstone design experience. Cadets apply the Mechanical Engineering Design Process and their knowledge of math, science, and engineering mechanics to design solutions to real-world engineering problems. They must address public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors. Students begin capstone assignments early in the course and continue their projects with ME496.</p>                                                                                                                                                               |                                            | 2026-1 2027-1 2028-1<br>2029-1                                |

| <p>Fundamental concepts are extended to the engineering analysis of coal, oil and natural gas fossil fuel systems to assess the dominant sources of energy and technologies in the electric power, transportation, industrial, and residential and commercial energy sectors. Renewable and alternative energy resources including solar, wind, biomass, hydro, geothermal, nuclear and ocean energy are assessed, along with analysis of conventional and emerging technologies to harness them. National and global energy issues are discussed with technical, economical, environmental, societal and geopolitical considerations and in the context of Army energy needs.</p> |                                            | 2027-2 2028-2 2029-2                                          |

| The course approaches the design of an aircraft from the principles of aerodynamics, stability, and control. A flight laboratory in the departments fixed-wing airplanes provide an opportunity to obtain data and analyze the stability and control of an actual aircraft. Lift, drag, and aerodynamic moments are studied for airfoils (2-D) and finite wings (3-D) in the subsonic flow regime. Theoretical concepts are demonstrated in laboratory sessions that include low-speed wind tunnel testing.                                                                                                            |                                                                                                                                                                                                                                                   | 2026-2 2027-2 2027-9<br>2028-2 2028-9 2029-2<br>2029-9        |

| In this course students develop a foundation in the analysis and design of free and forced single and multi-degree of freedom systems. Applications include modeling, damping, resonance, force transmissibility, vibration absorbers, matrix formulation and modal analysis. Emphasis is placed on vibrations examples from several engineering fields. Laboratory experiences provide students with the opportunity to apply principles taught in the classroom to physical systems, allowing the comparison of theoretical and actual vibrating systems. In-class demonstrations supplement the theory development. |                                                                                                                                                                                                                                                   | 2026-2 2027-1 2027-2<br>2028-1 2028-2 2029-1<br>2029-2        |

| The cadet pursues advanced study of a topic in mechanical engineering on an individual or small group basis, independent of a formal classroom setting. Similar to graduate level research, the scope of the selected project is tailored to the interests of the cadet based on resources and in consultation with a faculty advisor. To develop research skills, the cadet is integral in all phases of project completion by defining objectives, studying fundamentals and background material, outlining the approach, conducting analysis, and communicating results.                                            |                                                                                                                                                                                                                                                   | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| The cadet pursues advanced study of a topic in mechanical engineering on an individual or small group basis, independent of a formal classroom setting. Similar to graduate level research, the scope of the selected project is tailored to the interests of the cadet based on resources and in consultation with a faculty advisor. To develop research skills, the cadet is integral in all phases of project completion by defining objectives, studying fundamentals and background material, outlining the approach, conducting analysis, and communicating results.                                           |                                                                                                                                                                                                                                                       | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course provides in-depth study of a special topic in engineering mechanics or mechanical engineering not offered elsewhere in the USMA curriculum. Course content will be based on the special expertise of the Visiting Professor or a senior mechanical engineering faculty member.                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                       | 2026-8                                                        |

| This course provides in-depth study of a special topic in engineering mechanics or mechanical engineering not offered elsewhere in the USMA curriculum. Course content will be based on the special expertise of the Visiting Professor or a senior mechanical engineering faculty member.                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                       | No Course Offerings                                           |

| Students engage in the analysis, testing, and evaluation of internal combustion engines and their subsystems with a goal toward understanding the principles affecting performance and efficiency. Spark ignition and compression ignition engine systems are studied in detail, with laboratory events designed to connect theory and practice. Material explores modern technologies in use and under development which function to increase powerplant efficiency and decrease emissions. A series of design problems is interspersed throughout the course along with a semester long engineering design project. |                                                                                                                                                                                                                                                       | 2026-2 2026-8 2027-2<br>2028-2 2029-2                         |

**Scope:** 2026-1

**Offerings:**

Students engage in the analysis, testing, and evaluation of automotive powertrains and their subsystems with a goal toward understanding the principles affecting vehicle dynamics and platform performance. Wheeled systems are studied in detail, with laboratory events designed to connect theory and practice. A series of design problems is interspersed throughout the course along with a semester long engineering design project.

**Scope:** 2026-1

**Offerings:**

Weapons Engineering is an introductory course in armament and ordnance theory with an emphasis on analysis, design, and testing of ground combat weapon systems. The course covers the underlying principles affecting the generation and application of combat power at scales ranging from small arms (pistols, rifles) to large cannons (tank guns, howitzers). Theory is verified with laboratory exercises and experimental data. Concept analysis and component design problems are interspersed throughout the course, and a semester long Engineering Design Project (EDP) unifies the main course elements with a contemporarily relevant problem.

**Scope:** 2026-1

**Offerings:**

This course provides experience in the integration of math, science, and engineering principles into a comprehensive engineering design project. Open-ended, client-based design problems emphasize a multidisciplinary approach to total system design providing multiple paths to a number of feasible and acceptable solutions which meet the stated performance requirements. Design teams are required to develop product specifications, generate alternatives, make practical engineering approximations, perform appropriate analysis to support the technical feasibility of the design, and make decisions leading to an optimal system design. System integration, human factors engineering, computer-aided design, maintainability, and fabrication techniques are addressed. This course provides an integrative experience in support of the overarching academic program goal, and is often interdisciplinary in nature.

**Scope:** 2026-1

**Offerings:**

This course teaches cadets how to define and communicate new ideas to solve scientific problems in the context of challenging, modern technological problems facing the Army, Department of Defense, and society. Through participation in a speaker series, students engage with leaders from the DoD, academia, and industry to define their passions in STEM and select a cutting-edge problem for further study. Lessons on technical communication are interwoven to develop technical communication skills, focusing on writing detailed literature reviews, developing compelling technical proposals, and giving engaging presentations. Throughout the semester, students construct a research project proposal and presentation to argue an innovative solution to their chosen problem.

**Scope:** 2026-1

**Offerings:**

This course examines a range of advanced interdisciplinary topics in engineering. The focus is on development of the ability to effectively design and analyze experiments. Topics include processing of audio, thermal, and other data specific to the interests of the instructor team for each offering. Advanced topics such as compressible flow and turbulence will be explored in this course, but additional topics from civil engineering, computing services, electrical engineering, mathematical science, mechanical engineering, and physics may be explored. A heavy emphasis is placed on the ability to effectively assess potential uncertainties in experiments and to communicate technical results to an expert audience.

2027-1 2028-1 2029-1

**Lessons:** 28 @ 55 min (1.500 Att/wk)    **Labs:** 12 @ 55 min

**Special Requirements:** Admission to the course may be competitive and require permission from the Course Director.

| This course is taught by the Class of 1950 Chair of Advanced Technology, a visiting scholar with a distinguished record of academic and professional achievement in the field of engineering, science and technology. The seminars focus on topical issues that either reflect the Chair's area of expertise or are conducted by an expert in the field. Students will apply mathematics, science, and engineering fundamentals to evaluate equipment, processes, and concepts being used in the Army. The course has a final design briefing that is an integrative experience. Admission into course is with permission of Department Head. |                                                                                                                                                                                                                                                                             | No Course Offerings                                |

| XE 475 is a comprehensive introductory course in the field of mechatronics. Mechatronics is the crossroads in engineering where mechanical engineering, electrical engineering, computer science, and controls engineering meet to create new and exciting real-world systems. Knowledge of mechanical and electrical components, controls theory, and design are integrated to solve actual physical design applications.                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                             | 2026-1 2027-1 2028-1<br>2029-1                     |

| This course challenges students to solve a complex engineering problem in teams. The design problems will be open-ended in nature and involve the application of math, science, and engineering principles acquired in previous coursework. The students will be assigned to a team and project, and use an iterative design process to define the problem, analyze alternatives, and select the best alternative to solve the problem. Teams will communicate their recommendation for a design solution and determine the applicable standards associated with their problem. Work on this problem will continue in the next course: XE495. |                                                                                                                                                                                                                                                                             | 2026-1 2027-1 2028-1<br>2029-1                     |

---

This course continues the process initiated in XE485. Students will implement, test, model, and communicate their solution to solve a complex engineering problem in teams. In addition, the teams will document their work and reflect on how the project met the design requirements as outlined in ABET. The teams will also communicate the social, technical, economic, and political impact of their designs

**Lessons:** 2 @ 150 min (2.000 Att/wk)      **Labs:** 28 @ 150 min

**Special Requirements:**                      Enrollment in XE495 is subject to Course Director approval.

| DS320 is the introductory course of the Defense & Strategic Studies major and therefore covers the foundational concepts within the field. This course addresses the enduring and contemporary issues of strategy by studying key components of international relations, geopolitics, military theory, and grand strategy. Cadets will apply course concepts through traditional coursework such as papers, presentations, and exams. Lastly, the course aims to develop foundational skills in research, writing, and critical thinking to enable success as a DSS graduate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                      | 2026-1 2027-1 2029-1                                          |

| This interdisciplinary course examines the subject of military innovation from a theoretical, strategic, historical, and policy oriented perspective. DS 345 addresses several key questions: Why do militaries innovate? How does this process of innovation occur? Why do attempts at military innovation succeed or fail? To answer these questions, this course introduces the innovation concept and ties innovation to the levels of war. It provides the historical narrative to military innovation, while emphasizing the contemporary operating environment by exploring the possibility of a recent Revolution in Military Affairs through emerging technologies and the international security environment.                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                      | 2026-1 2027-1                                                 |

| Leaders must possess the ability to communicate complex ideas clearly and concisely, both verbally and in writing. DS350 is grounded in the application of sound communication and narrative techniques relevant to the tactical, operational, and strategic levels of war. The course introduces the concept of information as an element of national power used to achieve U.S. strategic objectives. It then turns to how narratives are used to develop and execute strategy. Cadets gain foundational knowledge of how information is used to develop understanding, communicate, and act decisively. Students study interactions between the military and the media to understand influence campaigns and their effects during competition and conflict. The course culminates in crafting communication plans to tackle vital strategic challenges. Through a combination of theoretical understanding and practical application, cadets learn to develop strategic communication plans, engage with media effectively, and leverage information as a dynamic element of combat power. |                                                                                                      | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2029-1<br>2029-2 2029-8 |

| This course explores the nature and dynamics of low-intensity conflict in contrast to conventional and high-intensity warfare. Specifically, cadets will examine the strategy and tactics of insurgency, counterinsurgency, international terrorism, and peace operations. Another component of this course examines Special Operations Forces (SOF) by exploring the unique methods of special operators and their relationship with irregular warfare. Cadets will examine how U.S. SOF are organized, how special operations in general succeed, and why SOF are well-suited for low-intensity conflict. Several relevant guest speakers are integrated into the instruction throughout the course.                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                      | 2026-1 2027-1                                                 |

**Scope:** 2025-1

**Offerings:**

This course introduces cadets to foundational concepts within US national security policy, strategic theory, and military strategy. Cadets analyze the decisions of US policymakers through practical case studies and contemporary events by applying major theoretical concepts in defense strategy and policy through individual critical thinking, group collaboration, and oral and written communication. Cadets will be able to understand, analyze, and effectively communicate the relation of tactical action to national policy within the context of the US defense establishment.

2026-2 2027-2 2029-2

**Lessons:** 30 @ 75 min (2.000 Att/wk) **Labs:** 0 @ 0 min

**Special Requirements:** None

**Prerequisite(s):** DS320

| <b>DS399</b> | <b>STRATEGIC STUDIES INTERNSHIP</b> | <b>3.0 Credit Hours</b><br><b>(BS=0.0,ET=0.0,MA=0.0)</b> |
|--------------|-------------------------------------|----------------------------------------------------------|

---

**Scope:** 2023-2

**Offerings:**

The Academic Individual Advanced Development (AIAD) program is designed to give cadets practical experience in their field of study and to reflect on their experiences by completing specified requirements. Current AIADs that cadets may potentially execute for credit include domestic and international staff rides and internships to areas of strategic relevance, though AIAD availability will vary by year. Instructors, students, and host agencies will develop a specific academic plan prior to executing the AIAD that will require either department or curriculum review depending on the nature of the trip. Students will normally complete specially assigned readings, a daily reflective journal based on their practical experiences, and write a term paper that benefits the host organization or expands on the AIAD's purpose. The assigned instructor will provide feedback on student submissions and assign term grades accordingly.

2026-7

**Lessons:** 0 @ 0 min (0.000 Att/wk) **Labs:** 0 @ 0 min

| <b>DS455</b> | <b>COMPARATIVE DEFENSE POLICY</b> | <b>3.0 Credit Hours</b><br><b>(BS=0.0,ET=0.0,MA=0.0)</b> |
|--------------|-----------------------------------|----------------------------------------------------------|

---

**Scope:** 2023-2

**Offerings:**

This course's objective is to analyze the defense policies of various countries and the outcomes of those defense policies, to include national security objectives, national military objectives, military doctrine, force structure, and military capabilities. Countries studied will include actual and potential coalition partners and potential adversaries. Cadets will examine the political, economic, and social influences on each military establishment. Cultural influences on the development and implementation of the defense policies for countries studied will be examined, including the effects each country's culture has on the missions, structure, roles, and capabilities of the military. Cadets will develop their own framework of analysis to critically analyze the defense policies and cultures of other countries, and will be able to clearly articulate that analysis through written and oral means. Guest speakers include liaison officers and Foreign Area Officers to provide insight into the specific military establishments of those countries studied.

2026-1 2026-2 2026-8  
2026-9 2027-1 2027-2  
2027-8 2027-9 2029-1  
2029-2 2029-8 2029-9

**Lessons:** 30 @ 75 min (2.000 Att/wk) **Labs:** 0 @ 0 min

**Special Requirements:** A comparative study with a 2500-word paper and a class presentation; compensatory time provided.

**Prerequisite(s):** SS307  
-Or-  
SS357

| <b>DS460</b> | <b>IRREGULAR WARFARE THEORY &amp; PRA</b> | <b>3.0 Credit Hours</b><br><b>(BS=0.0,ET=0.0,MA=0.0)</b> |
|--------------|-------------------------------------------|----------------------------------------------------------|

---

**Scope:** 2025-2

**Offerings:**

This course explores the social, political, economic, and military dynamics of irregular warfare, focusing on the tactical to strategic intricacies of conflict among state and non-state actors. Cadets gain insights into the complexities of irregular warfare in competition and conflict through a comprehensive examination of theoretical frameworks and practical case studies.

| This course introduces cadets to the interdisciplinary nature of decision-making by addressing how leaders make decisions in situations of incomplete, conflicting, and incorrect information using forecasting, modeling, and gaming. The curriculum enables cadets to synthesize long-term developments and potential future scenarios through forecasting and trend analysis. It requires cadets to apply lessons in a series of complex, competitive games. Cadets will leave the class with a basic understanding of the complexities involved in strategic decision-making and methods to frame, understand, and address that complexity.                                                                                                                                                                                                                                                                                                                                                                                                  |                                                       | 2026-2 2027-2 2029-2                               |

| This course provides a historical, theoretical, and practical understanding of the roles of sea, air, space, and cyber power in military strategy and national security policy. After establishing a strong theoretical and historical foundation in each of the domains, students apply acquired knowledge to assess the strategies of multiple state and non-state actors, and to make practical recommendations on the application of military power across all domains to affect the outcomes of competition, crisis, and conflict.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                       | 2026-1 2027-1 2029-1                               |

| The course provides an environment that is conducive to independent effort in a subject area of special interest to the cadet. Original research or specialized study can be accomplished in any of the many fields within Defense and Strategic Studies. The course is conducted in three phases. First, the cadet and the individual advisor from the Defense and Strategic Studies faculty will reach agreement on a subject area for research. Research methods will be studied under the direction of the faculty member. Research may involve field trips and personal interviews with experts in the area of study. In the second phase, the cadet will engage in independent research and prepare a draft analytical paper or report detailing the findings. During this period, frequent consultation with the faculty advisor occurs regarding the progress in the project. In the third phase, the cadet will present and define the findings before a faculty committee.                                                             |                                                       | 2027-1 2029-1 2029-2                               |

| The course provides an environment that is conducive to independent effort in a subject area of special interest to the cadet. Original research or specialized study can be accomplished in any of the many fields within Defense and Strategic Studies. The course is conducted in three phases. First, the cadet and the individual advisor from the Defense and Strategic Studies faculty will reach agreement on a subject area for research. Research methods will be studied under the direction of the faculty member. Research may involve field trips and personal interviews with experts in the area of study. In the second phase, the cadet will engage in independent research and prepare a draft analytical paper or report detailing the findings. During this period, frequent consultation with the faculty advisor occurs regarding the progress in the project. In the third phase, the cadet will present and define the findings before a faculty committee. DS489A can only be taken after a cadet has completed DS489. |                                                       | 2027-1                                             |

| The Special Topics Course provides cadets an opportunity for reading and analysis in depth within a topic area of special interest and timely relevance to Defense and Strategic Studies. The course director will determine the approach dependent on the topic and enrollment. Courses will normally develop the cadet's understanding of the topic through study of theory, history, doctrine, and historical and contemporary case studies. A generous portion of the course will normally address modern complex problems related to the topic area and assignments will emphasize analytical writing. Topics will vary by semester. A past Special Topics Course was "Sea and Air Power."                                                                                                                                                                                                                                                                |                                                                                          | 2027-1 2029-1                                      |

| This is a research methods course designed to support the interdisciplinary nature of the research-based courses in the Defense & Strategic Studies Program, DS496 Strategic Studies Thesis and DS498 Strategic Studies Capstone. In this course, students will learn different research methodologies for the strategic studies field and develop effective writing skills in a seminar format. Partway through the semester students will choose an interdisciplinary research topic related to the Defense & Strategic Studies field. The topic, approved by the Course Director, will either be as part of a student-selected thesis for DS496 or an assigned client-based project for DS497. Thesis students must also select faculty members from across the institution to serve as their thesis advisors as part of DS495. Student assignments include practical exercises, a research proposal, a literature review and a draft research methodology. |                                                                                          | 2026-1 2027-1                                      |

| Strategic Studies Thesis is an integrative course in strategy designed to provide Defense & Strategic Studies majors with practical experience in addressing real, complex and ambiguous strategic issues. Students will write and defend an interdisciplinary thesis that in some way relates to the military instrument of power or national security. Thesis cadets will continue the work they began with their faculty advisors in the fall by revising their literature review and research methodology, then complete data collection, data analysis, thesis writing and ultimately conduct an oral defense of their thesis before an interdisciplinary faculty board.                                                                                                                                                                                                                                                                                  |                                                                                          | 2026-2 2027-2 2029-2                               |

| Strategic Studies Thesis is an integrative course in strategy designed to provide Defense & Strategic Studies majors with practical experience in addressing real, complex and ambiguous strategic issues. Students will write and defend an interdisciplinary thesis that in some way relates to the military instrument of power or national security. Thesis cadets will continue the work they began with their faculty advisors in the fall by revising their literature review and research methodology, then complete data collection, data analysis, thesis writing and ultimately conduct an oral defense of their thesis before an interdisciplinary faculty board.                                                                                                                                                                                                                                                                                  |                                                                                          | 2026-1 2027-1                                      |

| Strategic Studies Capstone is an integrative course in strategy designed to provide Defense & Strategic Studies majors with practical experience in addressing real, complex and ambiguous strategic issues. Students will work in small groups to solve such a problem for an external client organization focusing on the use of the military instrument of power or national security strategy. Student groups will determine stakeholder needs, define the client's problem, and conduct appropriate research to develop a viable solution or set of recommendations. Groups will meet regularly with their client, complete a final written report and provide a formal presentation with an oral defense to the faculty. Alternatively, select students may work with an interdisciplinary team from another academic department's capstone course to contribute analysis from the strategic studies perspective to the group's project. Capstone cadets will continue the work they began with their faculty advisors in the fall by revising their literature review and research methodology, then complete data collection, data analysis, final report writing and ultimately conduct an oral defense of their work before an interdisciplinary faculty board. |                                                                                            | 2026-2 2027-2 2029-2                               |

| Strategic Studies Capstone is an integrative course in strategy designed to provide Defense & Strategic Studies majors with practical experience in addressing real, complex and ambiguous strategic issues. Students will work in small groups to solve such a problem for an external client organization focusing on the use of the military instrument of power or national security strategy. Student groups will determine stakeholder needs, define the client's problem, and conduct appropriate research to develop a viable solution or set of recommendations. Groups will meet regularly with their client, complete a final written report and provide a formal presentation with an oral defense to the faculty. Alternatively, select students may work with an interdisciplinary team from another academic department's capstone course to contribute analysis from the strategic studies perspective to the group's project. Capstone cadets will continue the work they began with their faculty advisors in the fall by revising their literature review and research methodology, then complete data collection, data analysis, final report writing and ultimately conduct an oral defense of their work before an interdisciplinary faculty board. |                                                                                            | 2026-1 2027-1                                      |

| Clausewitz states that the violent, interactive, and fundamentally political nature of war is unchanging. The character of war, however, changes with technology, society, and the international political system. This course integrates previous instruction from DS320, DS370, and academy core courses on leadership and strategy while exploring how emerging technologies interact with the contemporary international environment to influence the character of war. Cadets analyze how technologies like artificial intelligence, autonomous weapons, social media, cyber, and drones might influence the future of war and create the need for adaptive leaders. In line with strategic guidance, this course emphasizes intellectual leadership and professionalism in the art and science of warfighting, deepens Cadets' understanding of history, and embraces the role of emerging technologies to better prepare leaders to compete with adversaries. DS498 seeks to deepen this understanding through case study analysis, written and oral communication, and collaborative projects.                                                                                                                                                                    |                                                                                            | 2026-2 2027-2 2029-2                               |

ML100 Introduction to Warfighting Laboratory is a forty-seven-day period of instruction for Fourth Class cadets at the United States Military Academy. ML100 is offered during the summer term as part of Cadet Basic Training (CBT). CBT is a demanding progression of training requirements that forms the foundation for all future instruction at USMA. It instructs, trains, inspires, and transitions civilians and prior service military personnel into Cadets and future officers. CBT also inculcates attributes expected of future officers, including foundational military competencies and the values of character and commitment.

**Offerings:**

ML200 Introduction to Small Unit Operations Laboratory is a six-to-eight week program of instruction for Third Class cadets at the United States Military Academy. ML200 is offered during the summer term as part of Cadet Field Training (CFT I and CFT II). ML200 expands on the knowledge gained in MSL100 and MS100 by providing hands on application of concepts and lessons in a tactical field environment. Cadets perform select BOLC-A tasks in order to further develop the military and tactical knowledge necessary for future field training and lays the foundation for subsequent Military Science courses. The purpose of ML200 is to emphasize the foundational military competencies; prepare Third Class cadets to assume duties as NCOs in the Corps of Cadets; instill the warrior ethos in each cadet; and inspire each cadet to professional excellence through physically and mentally demanding training.

**Scope:**

2021-1

**Offerings:**

Cadets are enrolled in ML300 during their second or first class summer. This course trains, mentors, and assesses basic leadership skills focusing on Troop Leading Procedures (TLPs), effective communication, and tactical decision making in order to develop competent and confident small unit leaders capable of operating in an uncertain and rapidly changing environment. In a series of tactical scenarios that reflect the Decisive Action Training Environment, cadets experience a minimum of two assessed leadership positions which provides the cadet with a common experience to further enhance his/her leadership ability to solve difficult tactical problems.

| ML300A CLDT Sandhurst is a 28-day period of instruction for rising Second- and First-Class cadets held at the Royal Military Academy at Sandhurst in the United Kingdom. ML300A is offered during each summer term to Cadets who demonstrate excellence across all three pillars. It is a demanding progression of training requirements that serves as a culminating event for all military training at USMA. CLDT ML300A evaluates Cadet leadership potential through execution and assessment of core warrior skills and a tactical field problem in order to improve their competence and fitness for future service as leaders within the Corps of Cadets and as commissioned officers in the United States Army. Cadets who successfully complete ML300B will receive credit for their ML300 requirement in lieu of participating in CLDT at USMA. |                                       | 2027-0 2028-0 2029-0                                          |

| This course provides an enhanced understanding of the roles and responsibilities of junior officers to expand beyond the basic warfighting mission taught in the military science curriculum. ML401X introduces cadets to the requirements of junior officers beyond tactical mission planning and challenges cadets to produce products required of them during their first assignments. Throughout the course, cadets demonstrate their knowledge through a series of lessons that introduce cadet to the systems and processes the Army uses in daily operations and how to understand and develop each of the products within the systems. Cadets who successfully complete ML401X are postured to excel in their first Army assignments.                                                                                                            |                                       | 2026-1 2026-2                                                 |

| This course provides cadets with the foundation of military and tactical knowledge necessary for future field training and development in subsequent military science courses. Cadets will gain a solid foundation built on basic Army concepts such as Shoot, Move, and Communicate. Cadets will also learn fundamental Army unit organizations, capabilities and missions, and develop an understanding of the roles of NCOs and Officers. Cadets who have successfully completed MS100, will understand their role as Soldiers and will be well prepared as they transition from follower to leader during the next chapter of their military education, Cadet Field Training.                                                                                                                                                                        |                                       | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

Cadets will also learn fundamental Army unit organizations, capabilities and missions, and develop an understanding of the roles of NCOs and Officers. Cadets who have successfully completed MS100, will understand their role as Soldiers and will be well prepared as they transition from follower to leader during the next chapter of their military education, Cadet Field Training. *This is a pilot version of MS100 and must go through the Curriculum Committee for review NLT AY26-2 to continue.*                                                     |                                       | 2026-1 2026-2                                                 |
| <b>Lessons:</b> 40 @ 55 min (2.500 Att/wk)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Labs:</b> 0 @ 0 min                |                                                               |

This course introduces cadets to the small unit leader's role in the Army by developing the foundational tactical knowledge, critical thinking and problem-solving skills necessary for adaptive leaders in current and future operational environments. Fundamentals of Small Unit Operations builds upon the knowledge, competencies and experience cadets gain in MS100 and Cadet Field Training. It explores Army leadership, troop leading procedures, and small-unit tactics to develop and hone decision-making skills. Throughout the course, cadets demonstrate their knowledge through a series of tactical decision exercises, mission briefing assignments, written assessments, and simulations lab activities. Cadets who successfully complete MS200 are able to apply problem solving techniques to unstructured tactical problems and scenarios, use and incorporate battle drills, demonstrate foundational military competencies, and execute principles of patrolling and planning in a multi-domain operational environment.

**Scope:** 2026-1

**Offerings:**

This course provides an enhanced exploration of MS200 course material by introducing cadets to the small unit leader's role in the Army by developing the foundational tactical knowledge, critical thinking, and problem-solving skills necessary for adaptive leaders in current and future operational environments. Advanced Fundamentals of Small Unit Operations builds upon the knowledge, competencies and experience cadets gain in MS100 and Cadet Field Training while further challenging cadets on its respective application to modern Army leadership, troop leading procedures, small-unit tactics, and decision-making skills within the context of complex and real-world problem sets. Throughout the course, cadets demonstrate their knowledge through a series of tactical decision exercises, development of operational planning products and orders, mission briefings, written assessments, and simulations lab activities. Cadets who successfully complete MS250 are postured to excel in follow-on advanced military instruction and can apply problem solving techniques to unstructured tactical problems and scenarios, use and incorporate battle drills, demonstrate foundational military competencies, and execute principles of patrolling and planning in a multi-domain operational environment.

**Scope:** 2022-0

**Offerings:**

This course builds upon foundational tactical planning and decision-making skills taught during MS200. MS300 further develops the cadet's knowledge of doctrinal tactical principles and general professional knowledge, using Troop Leading Procedures (TLPs) as a framework for planning and preparation. Cadets are challenged to apply tactical knowledge, competencies, and decision-making to solve complex situations that require critical thinking and creative problem-solving skills. Instruction in the fundamentals of small unit operations emphasizes both offensive and defensive tactics. Additionally, cadets are expected to demonstrate an increased understanding of the TLPs and mental agility through execution of tactical decision-making exercises. In addition to tactics, cadets continue their general instruction in the various Army systems, procedures and functions that are important aspects of officership. Finally, cadets examine the small unit leader's role in ensuring that the moral and ethical decision making process is integrated into all operations.

| In this 3.5 hour time block Cadets are taught rudimentary grappling techniques. In this block of instruction the New Cadets are introduced to the following positions: Guard, Top Mount, and Side Control. The New Cadets learn how to hold and escape from these positions and also learn submission holds to apply to their partner when they are in the dominant position.                                                                                                                                                                                                                                                                                                          |                                     |                                                                                    |

| This introductory movement and fitness course is designed to improve a cadet's upper body strength, hip flexor strength, and core body stabilization and to prepare him or her for success in PE 117 (Military Movement). The class focuses on developing the specific strength and skills needed to pass PE 117 (Military Movement) and the Indoor Obstacle Course Test.                                                                                                                                                                                                                                                                                                              |                                     |                                                                                    |

| The purpose of this course is to physically develop cadets utilizing progressive and sequential resistance exercises and cardiorespiratory conditioning exercises that will enable them to pass the Army Physical Fitness Test and Indoor Obstacle Course Test. This course will provide cadets, who have a deficient Physical Performance Score Cumulative, an opportunity to supplement/raise their PPSC. Cadets will develop a sense of self-responsibility for their personal fitness and a lifetime commitment to maintain their physical fitness. This course will only be offered during Summer Term Academic Program.                                                          |                                     |                                                                                    |

| This course has two phases: phase one is a remedial swimming exploration curriculum designed to prepare cadets classified as non-swimmers for the survival swimming curriculum. The remedial phase is designed to help cadets acquire in-water experiences, and gradually refine the basic motor skills needed to be comfortable, safe, and effective in and around the aquatic environment. Phase two emphasizes the military applications of swimming and survival skills to include the elements of breath control, buoyancy positions, stroke assessment, and swimming endurance. Successful completion fulfills the survival swimming graduation requirement for selected cadets. |                                     |                                                                                    |

**Scope:** 2013-1

**Offerings:**

This course exposes Cadets to variety of basic standing and ground skills. Cadets learn how to engage in the free movement range, clinch range, and grappling range. In the free movement range Cadets learn how to strike with their hands and defend themselves. In the Clinch range cadets learn how to close with their opponent, achieve the Clinch, then control their opponent using knees and movement. In the Grappling range Cadets learn how to move into and out of positions and apply submissions and chokes. Body mechanics, aggressiveness, and affective reactions are stressed.

**Scope:** 2006-1

**Offerings:**

A course in which the offensive and defensive skills of amateur boxing are taught. Course content includes stances, movement, basic punches (i.e. jab, cross, hook, and upper cut), defenses, strategies, and tactics. Instruction on refereeing, judging, and serving as a corner second are presented. Boxers are evaluated, assessed and provided feedback on their ability to box. The course exposes participants to the coping strategies necessary to deal with a physical threat.

**PE215****FUNDAMENTALS/PERSONAL FITNESS****1.5 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)**Scope:**

2025-1

**Offerings:**

The course emphasizes basic human physiology concepts and the mechanisms by which the body adapts to and benefits from physical training. Cadets will learn how to assess, develop, and maintain their individual physical, nutritional, and sleep readiness as defined by the Army's Holistic Health and Fitness (H2F) system. Activities will focus on improving strength, endurance, mobility, power and speed while utilizing body composition to enhance overall physical performance. Cadets will understand how to properly fuel for, prepare, and recover from physical activity utilizing appropriate nutritional behaviors and sleep strategies. Human performance optimization will be discussed in the context of motivation, commitment and perseverance. Cadets will leave the course with exposure to H2F concepts, and a comprehensive profile of their individual readiness.

(BS=0.0,ET=0.0,MA=0.0)**Scope:**

2011-2

**Offerings:**

This is a 19 lesson course featuring nine lessons of Pickleball and ten lessons of Badminton. Pickleball is a sport played by two, three, or four people. Pickleball uses a wooden paddle and whiffleball and is very similar to tennis. The course focus is on the rules of play and basic skill development of service and service return, forehand and backhand drives, volley and half-volley, drop shot, lob, and overhead smash. Additional instruction in basic offensive/defensive strategy and tactics is provided. Badminton is a sport played by two, three, or four people on the same size court as pickleball. Badminton uses a lightweight strung racquet and shuttlecock (birdie). The course focus is also on the rules of play and basic skill development of service and service return, forehand, backhand, drop shot, lob, and overhead smash. Offensive/defensive strategy and tactics are discussed. Grading is determined by a final exam in each.

| This course is designed to provide Cadets with the ability and knowledge necessary to play and coach the game of basketball. It is intended to assist students in developing basic skills for playing as well as teaching the fundamental basketball skills while nurturing an appreciation for basketball as a lifetime physical activity. In addition, leadership skills, team development, and the value of teamwork are stressed through live competition. Cadets are evaluated on their demonstration and knowledge of fundamental skills, performance on the James Naismith Basketball Obstacle Course, individual and team performance, and a written term end exam.                       |                                       | 2026-1 2026-2 2027-1<br>2027-2 2027-9 2028-1<br>2028-2 2028-9 2029-1<br>2029-2 2029-8 2029-9 |

| This course is designed to educate and expose Cadets in the realm of edge weapons and impact weapons. Cadets learn realistic offensive tactics, defensive tactics, weapon movement patterns, and footwork in order to engage an enemy who has an edge weapon or impact weapon or to use an edge weapon or impact weapon on the enemy in a hostile situation. The cadets are evaluated on their functional ability to perform the skill learned in the course and also on their ability to show tactful aggression and fear management.                                                                                                                                                            |                                       | No Course Offerings                                                                          |

| This course is designed to provide the cadets with realistic grappling applications and ground fighting skills to enhance their knowledge and warrior ethos to prepare them as future soldiers for unarmed combat and CQC situations. This course focuses on five different grappling positions: Mount, Guard, Side Control, Rear Mount, and scarf hold. Cadets learn how to maintain the positions, escape from the positions, submit from the positions, and strike from the positions. Cadets are evaluated in their function ability to perform skill-sets learned in class, and are also evaluated in their ability to manage their fear, keep their composure, and dominate their opponent. |                                       | 2026-1 2026-2 2026-8<br>2027-2 2028-2 2029-2                                                 |

| PE 228 is designed to certify cadets to teach U.S. Army Level I Combative Skills. Cadets develop a foundation of basic combative grappling skills and an aggressive mind set needed to engage and defeat an enemy in Close Quarters Combat (CQC). The course focuses on 15 basic grappling skills. Cadets are evaluated on their demonstration and knowledge of the required skills. Successful completion of the course qualifies the individual to conduct Skill Level I Combatives training for soldiers.                                                                                                                                                                                      |                                       | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2                                |

Cycling as a lifetime sport, is designed to take the beginner through a progressive program of bicycle training and instruction to include: proper mounting, balance, turning, ascending, and descending individually and in a group. The course labs are hands-on and focused on learning through practical application and drills on the bike. All riders are also introduced to basic bike maintenance and required to demonstrate baseline skills in preventive maintenance checks and services (PMCS). Classroom instruction is focused on the introduction of cycling principles and as a feedback forum for the riding labs.

**PE232 EMERGENCY WATER SAFETY**

**0.5 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2010-1

**Offerings:**

The purpose of this course is to introduce cadets who are already proficient swimmers, to first responder training in methodologies generic to Water Rescue, CPR, and Emergency First Aid. Cadets are exposed to a variety of distress and drowning scenarios, and will be able to demonstrate strategies and site specific response techniques essential to safely performing a water related assist and/or rescue. Course focus is on military application in both still water and theatre specific environments, with a special emphasis on emergency management protocol. Written evaluation, five skill-specific performance components, and successful completion of two comprehensive exit scenarios are required for successful course completion.

**PE234 LIFEGUARDING**

**0.5 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2010-1

**Offerings:**

This course focuses on a holistic approach to the duties and responsibilities of a trained professional lifeguard and exposes cadets to key elements and strategies related to accident prevention, surveillance methodology, and performance. Additional content and activities focus on emergency response, search and rescue, and duty specific incident/accident management. Cadets who successfully complete certification requirements may obtain professional accreditation/licensure in Lifeguarding, CPR/PR, Oxygen Administration, and Automated External Defibrillation (AED). Additional accreditation/licensure may also be available in both Open Water and Water park Lifeguarding. Written evaluation, four skill-specific performance evaluations, and successful completion of three comprehensive exit scenarios are required for successful course completion.

**PE236 GROUP EXERCISE LEADERSHIP**

**0.5 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2013-1

**Offerings:**

Using music as the controlling factor, this course is designed to give participants an opportunity to experience different modalities of exercise such as high/low impact, step, kickboxing, circuit training, spinning, yoga/pilates and water exercise in an Exercise to Music group fitness setting. Participants will be assessed on knowledge of applicable fitness principles, exercise safety, lesson construction and a team-teaching experience of one's choice.

**PE238 GOLF**

**0.5 Credit Hours**  
(BS=0.0,ET=0.0,MA=0.0)

**Scope:** 2010-1

**Offerings:**

This course is designed to provide the beginner and novice golfer with the skills, knowledge, and techniques needed to play golf. The basic techniques taught are the full swing, pitching, chipping, and putting. Course grading is based upon a series of skill tests, a written examination, and a golf swing analysis.

| This course is designed to provide cadets who have little or no previous skating experience with the basic skills necessary to safely participate as a recreational skater. The forward and backward stroke, snow plow, "T" stop, and hockey stop, as well as forward and backward crossovers are presented. Additional skills taught are turns, spins and jumps. Grading is based upon the cadet's ability to demonstrate the skills taught during the course. A compulsory skating routine is also used for evaluating student proficiency. Additionally, a short creative routine of optional figures chosen by the cadet is evaluated. |                          | No Course Offerings                                                            |

| The purpose of this course is to introduce judo as a competitive sport and the application of judo skills for self defense and combatives training. The course content will include falling skills and basic throwing, pinning, and submission skills. Judo customs, courtesies, terminology, and competitive rules will be introduced. Students will gain an entry level knowledge and understanding of the basic skills, safety concerns, and rules needed to participate in competitive Judo. Students will be graded on a demonstration of basic skills and knowledge of competitive rules and terminology.                            |                          | 2026-8 2029-1 2029-2<br>2029-8 2029-9                                          |

| This introductory course provides cadets with the knowledge and hands-on experience for conducting Olympic Weightlifting. Cadets develop the critical skills needed for coaching and demonstrating safe and proper Olympic Weightlifting technique that will benefit both them and their soldiers. This course is designed to instill a lifetime desire for continued participation in training and competing in Olympic Weightlifting.                                                                                                                                                                                                    |                          | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 2029-8           |

| This course introduces the basic skill and strategy fundamentals of racquetball. Cadets learn to identify and demonstrate the basic fundamentals of: personal playing safety; rules of play; forehand and backhand stroke techniques; kill, passing, and defensive shots; serve, serve return techniques and strategies. Singles play, doubles and "cut throat" are examined. Grading is determined by performance on two skills tests (rally & ceiling shot), and a written final exam.                                                                                                                                                   |                          | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2                  |

| This course develops fundamental rock climbing skills, techniques and safety awareness. This course introduces basic rock climbing systems, rappelling, belaying, knots, top roping, and assorted climbing skills. Course grading is based on climbing skills, rappelling skills, knowledge of basic rock climbing systems, and the application of judgment and safety practices in various situations.                                                                                                                                                                                                                                    |                          | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2028-1<br>2028-2 2029-1 2029-2<br>2029-8 |

| This course is designed to provide cadets with the basic skills and knowledge needed to safely participate in SCUBA diving and pursue certification as a National Association of Underwater Instructors (NAUI) Basic SCUBA Diver. Successful completion of this course leads to Confined Water Certification and the ability to enroll in Open Water training. The requirements of this course include the successful demonstration of skin and SCUBA diving skills, the ability to practice and adhere to safe diving activities, and the completion of a comprehensive, written final examination. Cadets who possess Scuba certification or are members of the Cadet Sky Diving Club are ineligible for this course. |                             | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| This course is designed to teach beginning skiers to ski in balance and control in all terrain and snow conditions. Knowledge of skiing equipment, proper body position, stopping, gliding, edging, sliding, turning, and carving is taught. The course grade is based upon skiing performance assessments administered on the slope.                                                                                                                                                                                                                                                                                                                                                                                   |                             | 2026-2 2027-2 2028-2<br>2029-2                                |

| This course introduces cadets to the basic skills and techniques of cross-country skiing. It emphasizes skill development and the benefits of skiing as a lifetime fitness activity. Cadets are required to successfully demonstrate the diagonal stride, skating, turning, uphill techniques, and downhill techniques. Course grading is determined by instructor, peer and self-assessment of skiing ability and a written examination.                                                                                                                                                                                                                                                                               |                             | No Course Offerings                                           |

| This course is designed to provide cadets with the basic skills and knowledge needed to safely participate in snowboarding. The course focuses on teaching beginning snowboarders to ride in balance and control in various terrain and snow conditions. Knowledge of boarding equipment, as well as skills in proper stance and balance, stopping, gliding, edging, turning, carving and basic freestyle maneuvers will be covered.                                                                                                                                                                                                                                                                                    |                             | 2026-2 2027-2 2028-2<br>2029-2                                |

| This course is designed to provide Cadets with the skills and knowledge necessary for playing soccer. A variety of individual skills and techniques are taught, as well as individual/team offensive and defensive strategies. The value of small sided games are used as building blocks that lead to full 11 aside matches. Grading for the course is based upon three skills test (juggling, passing, shooting) and a written examination.                                                                                                                                                                                                                                                                           |                             | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| The objectives of this course are to introduce cadets to applied concepts of Sports Physiology, conduct personal fitness assessments in DPE's Center for Physical Development Excellence facility, and perhaps complete an independent study examining a sports physiology issue. The cadet becomes familiar with the varied aspects of Sports Physiology and is able to demonstrate baseline and advanced knowledge of 'core principles.' Critical thinking and analysis is used in all endeavors. The personal assessments conducted in the lab and the independent study approach provides cadets with insightful physiological information that can enhance their personal fitness performance. |                                  | 2026-1 2029-1                                                                         |

| This course provides Cadets with the knowledge and hands-on experience for conducting a variety of resistance training exercises. Cadets develop the critical skills needed for teaching safe and proper resistance training techniques that will benefit both themselves and their Soldiers. Cadets are assessed in the following areas: demonstrate proficiency performing multi-joint strength exercises, understand foundational programming criteria, and effectively provide peer coaching.                                                                                                                                                                                                   |                                  | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2028-1<br>2028-2 2029-1 2029-2<br>2029-8        |

| This course is designed to develop basic tennis skills including the forehand and backhand groundstrokes, serve, and volley. Students also learn the basic rules and etiquette of tennis as well as simple singles and doubles strategies. Grading is based on skills tests, an in-class tournament, instructor stroke evaluations, and a written final examination.                                                                                                                                                                                                                                                                                                                                |                                  | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2028-1<br>2028-2 2029-1 2029-2<br>2029-8        |

| This course is designed to teach cadets the fundamentals of volleyball. The individual skills taught are the underhand pass, set, serve, block, and spike. Additionally, the course covers defensive and offensive formations, the transition game, officiating techniques and United States Volleyball Association (USVA) rules. Grading is based upon skill testing on the underhand pass, set and serve, a written test, and a round robin tournament.                                                                                                                                                                                                                                           |                                  | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 2029-8                  |

| This introductory course provides cadets with the knowledge and experience for participating in Yoga. Cadets develop the skills needed for executing, teaching, and demonstrating safe and proper Yoga poses that will benefit both them and their soldiers. This course is designed to instill a lifetime desire for continued participation in Yoga and Mindfulness.                                                                                                                                                                                                                                                                                                                              |                                  | 2026-1 2026-2 2026-8<br>2027-1 2027-2 2028-1<br>2028-2 2029-1 2029-2<br>2029-8 2029-9 |

| The lifetime sports skills series are credit courses intended to provide cadets an opportunity to learn additional sports skills which can be incorporated into lifetime fitness goals and activities. They will further the development of neuromuscular and kinesthetic abilities through the acquisition of and participation in sport skills and can be part of the cadet personal fitness programs. Specific lifetime sport activities are selected on the basis of current trends, resources, instructor expertise, and cadet needs.                                                                                               |                                       | 2026-2 2027-2 2028-2<br>2029-1 2029-2                         |

| The Survival Swimming-Elementary course is designed to develop aquatic proficiency for cadets who swam 150 yards in 4 minutes or more on their initial entry swim classification test. The Program of Instruction (POI) is divided into two areas: basic swimming and combat/survival swimming. Emphasis in all levels is on the military applications of swimming and survival skills to include the elements of breath control, buoyancy positions, stroke assessment, and swimming endurance. Grading is primarily based on criterion-referenced scales in basic and survival swimming skills.                                        |                                       | 2026-1 2026-2 2027-1<br>2027-2 2028-1 2028-2<br>2029-1 2029-2 |

| The Survival Swimming-Advanced course is designed to develop aquatic proficiency for cadets who swam 150 yards in less than 2 minutes 30 seconds on their initial entry swim test. The Program of Instruction (POI) is divided into two areas: basic swimming and combat/survival swimming. Emphasis in all levels is on the military applications of swimming and survival skills to include the elements of breath control, buoyancy positions, stroke assessment, and swimming endurance. Grading is primarily based on criterion-referenced scales in basic and survival swimming skills.                                            |                                       | 2026-1 2026-2 2026-3<br>2027-3 2028-3 2029-1<br>2029-2        |
